

# PSYMENTOLOGY

(The Interuniversal Mind-Psychology)

Mohammad Ali Taheri

# Preface

I founded "**psymontology**" or **Interuniversal mind- psychology** thirty years ago. Psymontology has successfully gone through its experimental stages in the last two decades. This type of treatment has been introduced in the name of psymontology in the scientific assemblies in the last five years.

Psymontology originated when I was confronted with the truths and facts of existence in my childhood. I had some questions such as: "Where do we come from? Where are we going to? Why are we here? Who is the creator? What has he made the creation for? What is the outcome of this creation? Who is mankind? How can human approach the creator? How are the creator's potential powers activated? What are life and death? And..."

I was so eager to learn and comprehend the universe and to discover the world's mysteries. All of a sudden, I had some revelations of human being and existence on **November1st.1978**. Consequently, I perceived that there is a great Intelligence and Consciousness governing the universe. The Consciousness as well as a "cosmic Internet" has integrated all its constituent elements. This revelation was not only including the theoretical issues but also the applicable information and operational instruction. Therefore, due to the "**cosmic Internet**", some fields such as Faradarmani, Psymontology and some other fields are originated. We just study psymontology here. **Interuniversalism** is one of the outcomes of this doctrine. According to Interuniversalism, human should think at the level of the

universe. He should look at the universe vaster and finds his special status in the universe.

## **Chapter 1**

# **The Fundamental Philosophy**

## **Psymentology (The Interuniversal mind-psychology)**

Psymentology is a field of the complementary and alternative medicine of Iran. Psymentology studies the mind-psyche in the Interuniversal perspective. It has a comprehensive approach of human beings. The mind and psyche each are dealt as a separate concept in psymentology. Psymentology examines a specific part of individuals. This subject attempts to alleviate mental and psychic disorders.

### **Psymentology objectives:**

The main purpose of psymentology is the recognition of humankind, the human existential software, the diagnosis and the treatment of mental and psychic disorders as well as the unknown and unidentified disorders. Psymentology is pursued for the following purposes:

1. Acquiring self-recognition in order to truly define the human status in the universe.
2. Recognizing the constituent software of the human existence
3. Presenting the precise definitions of the human, transcendence, and perfection...
4. Assisting human for attaining:
  - a. Well-being
  - b. Well-doing
  - c. Well-having
  - d. Well-thinking

5. Diagnosing the mental and psychic disorders and improving the defective software of the human existence

6. Presenting the new definitions of the mental and psychic maladies, diagnosing and dissociating the normality and abnormality.

### **The General principles of psymatology**

\_ The human being has infinite number of interrelated components. So we need an Interuniversal view to analyze the existence of human in any framework. According to this view, human can be studied in the interrelated components all together.

\_ Man's behavior and character are lucidly interpreted when the philosophy of existence, man's nature and his status in the ecosystem are realized. Thus, other definitions of human are exactly illustrated, too. Considering this main fact, Psymatology pays special attention to the comprehension of man's status in the ecosystem.

\_ The mind, psyche, physique and the other constituents are considered all integrated and unified. Separating them apart would only lead to the false results.

Since Psymatology is an Interuniversal subject, all the internal and external elements relating to the human are totally studied.

### **Dimensions of the Human Existence**

In Psymatology, the dimensions of the human existence are defined on the basis of Interuniversalism. Interuniversalism has an omni-lateral/complete view of human being. In this viewpoint, the dimensions of human existence are limitless and comprise numerous

different software and hardware. All the hardware components are eventually managed by a software part.

Some components of human existence include:

\_ The different bodies such as: the physical body, psychological body, mental body, astral body...

\_ The various energy transformers known as "Chakra"

\_ The different energy channels like the fourteen non-physiological channels which are limited or blocked in the body. Acupuncture examines it.

\_ The numerous energy fields surrounding the body such as: polarity field, bio-plasma field ...

\_ The components such as: cellular consciousness, molecular frequency, several software parts and the other countless unknown elements.

In the Interuniversal approach, each component is studied in the relation to the other components. The mind, physique, psyche, other bodies and all components of human being are correlated together. So if any component is impaired, the other components will be destroyed. Therefore, it is impossible to be diagnosed an illness or a defective part of man's body unless there is the Intelligence system to exactly scan the body and diagnose and cure the defective part. Such an Intelligence Network known as Interuniversal Consciousness Network is applied via psymatology. In fact, this Network includes the Intelligence and Consciousness governing the whole universe. It functions just like a "cosmic Internet" which has placed all the components of the world under its intelligent coverage.

## **General subjects in psymtology**

Psymtology is divided into two general subjects:

### 1. Theoretical subjects:

- \_ The definitions relating to the human and recognizing the plan of his existence set-up
- \_ Understanding human's status in the ecosystem
- \_ Diagnosing the disorders of man's mind-psyche software and examining for the recovery methods
- \_ Explaining perceptual, emotional and behavioral problems

### 2. The practical subjects

This item includes a set of new methods for healing the mental-  
psychic disorders:

- \_ The circle of improving the sleeping quality
- \_ The circle of breaking bad habits (It is applied for oneself  
the others)
- \_ The circle of improving the underpinning software
- \_ The circle of Defensive Radiation level 5
- \_ The circle of Defensive Radiation, level 6

## **The approach and process of psymentology**

"Psymentology" or "Interuniversal mind- psychology" is a framework that cures via a software intervention. There is no hardware intervention in the healing process (the treatment does not physically perform medicinal/pharmaceutical treatment, surgical operation, physiotherapy, massage therapy, and any therapies that require hard devices). Although the current therapies such as psychoanalysis, psychotherapy are considered software treatments that are not applied in Psymentology. In fact, Psymentology is not technique-based. There is a precise difference between Psymentology and other treatments performed in psychology and psychiatry today. Psymentology attempts to understand mankind, the software of his existence, and also to cure man's unknown mental maladies. This type of treatment is a complementary and/or alternative medicine. So the Interuniversal Consciousness Network finds the defects and improves the software disorders via Psymentology process.

**The hardware intervention:** This kind of treatment depends on physical examination, medicinal treatments, surgery, physiotherapy, massage therapy or any other kind of therapies which require hard devices. The hardware treatment looks at human behavior as chemical reactions and phenomena.

**The software intervention:** It does not depend on the physical examination, medicinal treatment, surgery operation, etc. Psymentology treats software disorders. This kind of therapy diagnoses and cures sick people without any procedures.

## **Normality and Abnormality in Psymatology**

In Interuniversalism, normality includes the establishment of harmony and coordination with ecosystem and moving toward the goals of ecosystem. As a small member of this ecosystem, human must fulfill his role. Secondly, abnormality (illness) includes any disorder, blockage, damage and imbalance in any of the numerous parts of human being.

If we agree with the definition of illness in the viewpoint of Interuniversalism, it will be impossible to diagnose an illness. In current medicine, various specialized fields are created to achieve a more accurate diagnosis of an illness. Hence there will be a more applicable treatment procedure. Therefore, current fields of therapies are divided into several specialties so an illness can be more accurately diagnosed. In spite of this, a patient may get different opinions and diagnostic statements about his illnesses.

In Faradarmani and Psymatology, the healing is defined according to the definition of illness in the Interuniversal approach. Through these two complementary and/or alternative medicines, on the contrary to other medical fields, human has role neither in diagnosing with an illness nor with curing it. This diagnosis is achieved free from human intervention; but it is achieved via a Grand Consciousness. Scanning the patient's body, identifying the defective parts and afterwards curing the illness are fulfilled via this Grand Consciousness. Indeed, human existence is put under the magnifying glass of the Consciousness (Interuniversal Consciousness Network) through the scan process. As it is mentioned, human has different infinite components that are just scanned and improved via the Grand Consciousness.

## **Chapter 2**

# **Philosophical and Scientific Foundations of Psymatology**

## **Science and Experience**

Science studies the realities, finds the reasons and relationship among the components.

Reality is something which has been occurred. The realities leave their effects which are searched, traced, tested, recorded and repeated. These effects are classified into three general groups:

1. The realities which are traced by human's five senses.
2. The realities which are recorded and studied via the special tools and instruments.
3. The realities which exist but have not still been discovered.

Studying the cause of the occurrence clarifies a reason for each of the events. But it is not clear for some of other events. The realities are applied in the world of science when man is aware of the cause of their occurrences. So, these realities can be beneficial for human because he has the necessary facilities to use them.

For example, an airplane can fly on the basis of the "Bernoulli Principle". This principle states that as a fluid's velocity increases its pressure decreases and vice versa. Man has been using airplane and helicopter without knowing the cause of the occurrence of Bernoulli principle.

According to the historical documents, most of the scientific achievements had initially been considered as unusual and incredible phenomenon and against the common knowledge of their time, and

it is sometimes a superstition. For example, some decades ago, it was drawn an aura around the holy figures in the religious paintings. It was scientifically an unreal and superstitious. Nowadays, through Kirlian photography technology, we know that each human has a colorful aura around him.

Throughout history, it has been reported in several occasions of healing process, some people were cured through the touch. This case had not initially been accepted by the scientific society. Anyway, after some decades, one of the United States' universities has found out the map of the polarity field through the body and also the effect of such field on human health. Therefore, the course of polarity therapy or energy therapy was presented all over the world. Many people observed that one can cure through touching his head or body.

As a result, if the science rejects a matter orally or theoretically, it won't be proven that this branch has been failed. We can reject a subject when there is no valid experiments and documented tests and standard researches. All novelties and new thoughts has initially faced such comments through the science world. The scientists had refused to accept any subjects which was in conflict to their knowledge. They denied every innovation without any investigation and experiment. They did not even consider that such concept may be a reality. Nevertheless, at last they were ashamed of their confrontations. For example, there were such confrontation against homeopathy for two centuries. Finally, the science world observed the effects of this branch of treatment. Now homeopathy is well-known in the world. If this kind of therapy was at first supported via science, it could play the main role in medicine, in realizing the human beings and nature of illness now. So, such resistances have certainly postponed these benefits.

It is worthy to note that there is an interesting way through the world of science for opposing new ideas. Science, at first, denies the new innovations and resists to accept it as much as possible. There are some obstructions to reject these ideas. Yet, when the science has to withdraw, it will change its strategy against the new subjects. The considered matter takes the academic course through the world of science. So, it seems this subject has had the scientific base.

For example, acupuncture was initially called a tricky way by the world of science. Thus, the scientists stood against this kind of treatment but after a while they could not deny it. Therefore, they invented electronic acupuncture. In this way, they find the considered points via electrodes and continue the process of treatment.

Hypnotism is another case which was initially refused by the scientists. Nowadays, there is a course called the hypnotherapy and is presented the honored reports about it. But they never tried to express the regret to Anton Mesmer.

Dr. Samuel Hahnemann who proposed the theory of homeopathy died in poverty. Although he was honored after a while and his corpse was placed in Paris in a great burial ceremony. But it was too late! Who would undertake these crimes in the world of science? Those who have betrayed and will betray science are certainly the responsible of it.

### **Experience, Science and Question**

Man perceives and comprehends through a triangle framework which is known as experience, science and question (figure2-1). Which of these three items located before the other through the man's journey.

Figure 2-1.

We may immediately respond that the experience came first. It is true that we always get the experience through our life. But human needs to have a processing system to change the experience into science and knowledge. Anyway, he obtains the experiences and plays the mental games. Consequently, he reaches an obvious result that is called the experience. The processing system, itself, requires science. So, no processing system can record an experience without science.

Consequently, the experiences are applied via the science. There must be some unknowns that we need science. Science has an answer for each question. If there is no question, there will not be any science. Thus, human needs to face to questions at first and then answers them through science. In fact, there is no answer if we do not have any question. Therefore, science exists with the questions.

Human asks questions when he encounters the events. The events raise questions in his mind. So, if we do not experience, there won't be any questions.

Moreover, there is a paradox in this triangle. We do not know which of these items in this triangle has been created earlier. We can just

say that human is a unique creature who simultaneously reaches to each of these three items because of his special capabilities. indeed, these three items experience, science and question enhanced beside each other. They support each other.

### Science and Answers the Creation Puzzle

There is a main question if the world of science can answer the mystery of creation. For this reason, we draw a diagram that study man's questions according to the time axis versus the numbers of his questions (figure2-2).

Figure 2-2

The above diagram shows us that human initially has a few questions. He gradually faces more questions that they lead to the scientific branches. Then these branches cause the new questions. As time went by, numbers of questions and numbers of scientific branches has increased.

During the last decades, the number of proposed questions has been more than the numbers of total questions throughout the history of humanity. Now, there is one question that human does not still answer it. Hundreds questions are asked via the new scientific branches. Human will reach a point which is called " the question crisis". At this border, the number of new questions will be higher than the proposed answers, so it goes toward infinity; in other words:

The numbers of New Questions/The numbers of Answers= Infinity

Therefore, human will understand forever that science will never answer his questions to say: " I find the answers of all my questions."

### **The Origin of Science and Creativity**

There is an organized and purposeful framework of each system that is called "Logic". The universe is founded on an organized and purposeful framework. Intelligence is the capability of creation logic while wisdom is the capability of applying the framework of logic. So, intelligence is a necessity for creating logic and wisdom is necessary for applying the logic.

In other words, the creation engineering system is based on logic, intelligence and wisdom so that nothing is designed in vain. Thus, knowledge existing in the universe contains the data restored in the universe that is resulted from logic, intelligence and wisdom. Human can penetrate the data source and be an intellectual.

Man can extract knowledge of the universe designer by reading the book of existence. Indeed, man acquires the scientific data via his surrounding and environment. Man is floated in an ocean of knowledge thus each molecule existing in the air contains the data of existence. How can we penetrate the knowledge? Man knew nothing at the beginning of the creation but gradually accessed to lots of data of the existence.

Man is surrounded with a wall containing data of the existence. He accesses to this data when he can pass through this wall. The inner intelligence provides man for passing through this wall and penetrating data of universe. Furthermore, man can read the book of existence and understand the matters related to universe-cognition

via the inner intelligence (insight). Everyone holds the inner intelligence inside him that should be activated.

Man is designed and created in order to achieve the understanding mysteries of the universe. He is absolutely capable of creating, discovering and accessing to all information hidden in the existence. There is no border for man's inner intelligence if he discovers this capability within him. Thus, as long as man does not learn how establish a connection with the universe, his inner intelligence remains intact.

Man chiefly applies the framework of logic throughout his life; that wisdom is responsible of applying and enjoying the logic. Nevertheless, applying the logic and finding out the logical relationships misinterprets as intelligence. The abilities such as applying, memorizing, recalling categorize as the wise capabilities whose outcomes are stereotype. Therefore, man should activate his inner intelligence from childhood when he does not still familiarize with the stereotype matters. When an ordinary person plays a piece of a song with his mouth or says rhyming words without using the poetic elements like a child, he certainly enjoys his inner intelligence. Since intelligence is a child's primary/main ability, he/she can create something new. Child is not affected by stereotypes hence his limitless mind continuously innovates.

Each of man's inspirations (reaching the universe data) is resulted from his enthusiasm. He attains all information because of his eagerness. Man innovates because of his interest to learn and to know. The primitive man's most important question was who he/she was.

There are two steps of applying intelligence: the step of logic and the step of intelligence.

## The Steps of Logic and Intelligence

Intelligence requires a penchant /taste hence a person who innovates is known as a tasteful one. Yet, the penchant needs a motivation in order to occur a creation and innovation. Therefore, there must be an inner motivation to appear the inner intelligence. The inner intelligence is innate that requires a factor/an agent to be manifested.

Intelligence actually refers to wisdom or apparent intelligence which is developed in each new generation. Yet, the inner intelligence has retrograded from beginning of man's life. The inner intelligence is developed via man's taste and penchant by which takes his first pace towards enhancing the inner intelligence and avoiding depression. Moreover, the step of intelligence is higher than wisdom and is prior to wisdom, too (figure. 2-3).

Figure 2-3

When man measures the ratio of an individual's inquiry or comprehension to his knowledge, he finds out the importance of the inner intelligence. For example, if a kid answers a question which is not related with his cognitive development, he is known as a genius.

Yet, if a seven-year-old child answers the same question, nobody has the same judgement about him compared to the younger one. Thus, the younger child enjoys the inner intelligence which provide him with experiencing a new knowledge beyond the kid's conceptual knowledge.

Similarly, when man asked this substantial question: "who am I? And who is my creator?", his knowledge range was too narrow. This question is aroused after discovering the relationship between cause and effect that demonstrates existence of the inner intelligence. Nowadays, man substitutes the apparent or emotional intelligence for the inner intelligence.

There are ordinary people with the low apparent intelligence possess the high inner intelligence. For example, Einstein who had a low apparent intelligence created many innovations because of his high inner intelligence. The apparent intelligence is used for solving daily affairs and has no role in reading data of the book of existence.

The more we turn back to the last years, the more people with higher insights are observed. Now, man just comprehends the existence of insight which is something beyond wisdom via the communal soul. It seems that upcoming generations enjoy lower inner intelligence or insight. Nevertheless, man needs insight to develop an insightful generation.

### **Step of Logic and Step of Love**

Human beings is always faced with two steps to recognize and understand the universe: step of logic and step of love.

The step of logic is attributed to a step in which tools, techniques, advice, reasoning, rationalization, endeavor and effort are applied. Thus, this step refers to an area where is known as " world of

device". The step of love attributes to a world of joyfulness, enthusiasm, amazement, spiritual rapture, sacrifice and devotion. This step is a framework that is named as "world free of device".

The step of logic provides man for understanding the step of love. Since all deductions and outcomes occur on the step of logic, man cannot attain perfection without this step. Thus, the step of logic complements the step of love and vice versa. Nonetheless, no events occurred on each of these two steps is directly affected by the other step. Yet, the outcomes gained from each step is examined on the other step. For example, a person in love cannot be convinced through advice or reasoning to be given up his love. Moreover, technique and skill, science and knowledge or an intellectual contemplation cannot enable someone to compose a poem and show an enthusiasm. In other words, the world of love is the world of heart in which technique and skill are not acceptable. The world of love cannot also be accessible via endeavor, struggle and will power. For example, an individual may not try to fall in someone's love within the next few hours, or a person may not try to understand the truth existing in the universe. The outcomes of the world of love are spontaneously actualized.

A lover is considered as a crazy on the step of logic because the outcomes of love are not justified through logic. For example, the wisdom cannot confirm a person who sacrifices or devotes.

Therefore, the wisdom resists against any action which holds no tangible and material benefit. Moreover, the logic severely opposes affairs related to heart and love. For instance, when an individual tends to experience metaphysic and supernatural phenomena, the logic obstinately reacts against such phenomena and certainly denies existence of these cases. The world of love cannot be described

through words and may not be experienced via the logical tools compared to the world of logic.

There are two types of devices on the step of logic: main and intermediary devices. The main devices attribute to those which are directly and actually used such as science and knowledge, techniques and skills. The intermediary devices are those which are at the service of logical tools although these tools are not measurable and testable such as endeavor and effort, will power, imagination and visualization.

As earlier mentioned, the world of love contrary to the world of logic is not described and experienced via words. The world of love examines the quality of existence of the human beings and the universe. This world is known as the world of mysticism, love, heart or the world free of devices (figure2-4).

### **Philosophy, Mysticism and Religion**

Philosophy studies the fundamental nature of existence and phenomena of the universe as well as the attainment of the correct or incorrect reasons. This study attributes to apply logic from outlook of the wisdom (relationship between the nature of existence and the phenomena existing in the universe).

Man's findings are originated via experiencing, thinking, pondering, inspiring and attaining illumination and intuition. Man thinks about different phenomena of the universe thereafter he reaches correct or incorrect results. For example, a part of man's findings is related to philosophy and philosophical theories.

In general, all knowledge is created by the inspiration. The inspiration is man's mental spark which is originated via thinking and pondering so that he gained new knowledge. The mental sparks

which instantly occur contain different types. Yet, there is a common characteristic about the inspirations which are new. So, man encounters data which no one is informed of it before.

Since mysticism is founded on experiencing the connection with God, it significantly provides man for receiving the inspiration. Mysticism brings love and cognition for man. Mysticism can not only establish a deep relationship among all sciences but also provide man for connecting with the Lord. Ultimately, mysticism certainly bestows man the growth and perfection.

Mysticism is experienced from two theoretical and practical perspectives. In brief, practical mysticism exposes man to receive revelations and reach maturity through the connection with God. Theoretical mysticism refers to clarification of each revelation's content. Necessity of mysticism is felt when man tends to receive positive revelations through a divine journey. Thereby, he can experience a healthy life full of vividness and spirituality so that steps towards perfection. Therefore, each revelation requires to be examined/distinguished whether it attributes/belongs to divine or evil. Moreover, the primary criteria such as lack of violation of justice, covering other's flaws, lack of violation of one's free will and lack of violation of perfection in divine revelations should be ascertained. Although the received revelations should be examined in accordance to wisdom and the words said in the divine book, these revelations should also be proven/accepted by heart. Furthermore, in the age/time of face thoughts, everyone should present his knowledge to others in order to be evaluated. Thereby, man is provided for growing in a proper/right way as well as crusading for eradication of ignorance.

In addition to theoretical examination of the revelations' contents, there are some mystic experiences/achievements which should be studied and confirmed in practice. For example, one should experience the qualitative effects of praying practices; there are the mystic reports related to these experiments which are examined. So, the justness of some mystic theories is proven in practice.

The major inspiration and perception refer to God's message which is expressed in a frame of religious practices. There is an outcome of these perceptions that refers to refreshing/vivifying and enhancing man's motivation in praying and obeying God's commands.

Therefore, an individual who fulfils the religious practices comprehends that the purpose/ultimate goal of praying in all divine religions is applied to make peace with the whole. All unitary religions directly or indirectly invite and encourage human beings to establish a connection with the whole. Making peace with the whole ascribes to the meaning of "man's closeness to God".

"Closeness to God" refers to development of man's intimate relationship with God; yet there are different interpretations of this term among different people. Everyone can transcend others via moving towards the path of perfection. So, there is neither an end point for the path of perfection nor any restriction for man moving through this path.

Therefore, firstly there is a deep relationship between praying and mystic, secondly, all perfectible awareness is originated by the whole consciousness. Thereby, man enjoys the awareness when a constituent can establish a connection to the whole. This connection provides man with achieving cognition and unity and freeing him from conflicts. Thus, the term of mystic means moving from multiplicity to unity. Those who move in the mystical path attain

inner unity gained via mystic perception and awareness hence they achieve a unity-sighted.

Since man should recognize the role of the awareness in his life, he requires to be acquainted with four positive and transcendent characteristics of awareness. The first and second characteristics are common among all kinds of awareness (positive and negative awareness) while the third and fourth ones only belong to the positive awareness:

1. Being indescribable
2. Capable of transferring to the next life
3. Being coordinated to each other (do not violate one's positive awareness)
4. Being effective in the next life

The fourth characteristic presents the significant of the transcendence /superior awareness. There is only a belonging which is effective in leading man towards perfection in the next life. This man's belonging is his knowledge of perfection which is obtained through his earthly life. The knowledge of perfection which is ascribed to the cognitive data (the perceptual treasure) aids man to pass the next life.

In other words, man enjoys neither his scientific knowledge nor his abilities and skills in the next life. Man's thoughts and concepts are just effective in his earthly life so that are forgotten by passing time. Nevertheless, inspirations and inner effects thereof have no expiration date while provide man for moving in the path of perfection.

Therefore, importance and value of mystic seems to be undeniable. Thereby, man requires to find an appropriate way for entering mystic

world after identifying positive (divine) and negative (evil) inspirations. Thus, he can enjoy his positive inspirations and experiences in order to attain perfection.

## **Reality and Truth of the Existence**

There are two sides for everything in the earthly universe. Thereby, reality and truth are two sides of the same coin.

\_ **Existential Reality:** it refers to something which occurs

\_ **Existential Truth:** it refers to why and how something occurs, moreover the truth is attributed to plan of existence and the matters behind reality and qualitative part of the existence.

### **\_ Existential Reality and Existential Truth**

**Existential reality** of something indicates that it exists or comes to existence. Reality is studied without considering why or how an event occurs. There are some characteristics of the existential reality including being observed, impacting the environment, being recorded and measured. For example, a piece of stone is a real because the stone exists even though nobody knows how and why it comes to existence. Yet, there are many real phenomena in the universe although are visible for nobody such as infra-red light. Man can measure this light via specific devices thereafter can use in different applications.

**Existential truth** is in a relationship with existential reality and consists of:

**1. Why and how an event occurs:** for example, why does a stone come to existence? How is the universe created?

**2. Existential plan and whatever is behind the existential reality:** each reality forms in accordance to a plan. So, there are something

behind each reality that should be identified via studying the existential plan. For example, man can understand why he comes to the existence and what the purpose of this creation is. Thus, he discovers the philosophy of the creation of the universe.

**3. Existential quality of each phenomenon:** existential truth is examined according to existential quality of a reality. The origin of each event can provide man for identifying the event which is truth or virtual. For example, reflection of an image in a mirror is an existential reality but this image is not true; because the image of object is virtual compared to original object. So, each entity of the universe may be a real but the entity is not a truth compared to the original entity and vice versa. Some phenomena are not real in man's view while the existential truth of these cases proves their existential reality such as infra-red light. Since infra-red light cannot visible to man, he thinks this light is not a real. Yet, infra-red light is identified as a real phenomenon when he sees the light via modern equipment.

### **Earthly Universe from an Observer's View**

Suppose that a blade can spin around its central axis (figure.2-5). Does the blade have an existential reality in a stable state? The answer is yes; because this blade comes to the existence so it is real.

Now, suppose that the blade is rapidly spun/rotated around its central axis, afterwards we see a cylindrical shape. Thereby, the diameter of the cylinder's base is width of the blade and its height is the blade's length (figure. 2-6).

Now the question is: " is this cylinder is real?", the answer is yes, because the cylinder comes to existence. Yet, there is another question:" is this cylinder is a truth?", the answer is no, because such

cylinder has no external existence. The cylinder is disappeared as soon as the blade stops rotating. Therefore, the cylinder is a virtual volume which occurs by rotating the blade around its central axis. So, although the cylinder can be a real, it has no an existential truth.

According to these experiments, some other questions are aroused such as:

\_ Does the world surrounding us have existential reality? The answer obviously is yes, because man exists and he can observe the universe.

\_ Does the world surrounding us have also existential truth? The answer requires that we briefly examine the structure of the universe surrounding us as much as possible.

The universe surrounding us is made up of Matter and Energy. The material part of the universe is composed of the celestial bodies. The celestial bodies are made up of molecules, and molecules are made up of atoms which are formed from elementary particles and anti-particles/opposed particles. This procedure continues until negative infinity inside the atom's nucleus; so there is no initiate point of this procedure as there is no end one of it.

Now, we examine an atom as a building block which is the foundation of the creation structure. To examine more precisely, we suppose an atom as big as a football field that has a core as big as a soccer ball. In this view, the atom looks like a great sphere compared to its core. There is a question that:

\_ How are the atom's shape and size extended?

The shape and size of this great sphere (atom) resulted from movement of the electrons which leading to formation of the "Electron Cloud".

\_ Does this huge sphere have existential reality?

The answer is surely " Yes", because the sphere occurs so it is a real.

\_ Yet, does the sphere have an existential truth, too?

As soon as the electrons stop moving, this volume (which is resulted from the electron's motions) disappears. Thereafter, we see nucleus of this atom which is as big as a soccer ball. Consequently, the volume of atom does not exist in the outer world because the volume occurs at result of the electron's motion. So, this volume is virtual.

Similarly, we can examine atom's nucleus which is made up of proton and neutron. Proton orbits the nucleus while neutron speedily vibrates in the place and orbits proton in an opposition direction. Rotation of neutron around the proton creates a disc shape which is a virtual mass. Now, if the spin of proton and neutron is stopped, the created mass disappears hence atom's volume becomes less and changes into elementary particles. Similarly, movements of the underneath levels of atom are subsequently stopped so that each created mass in each level disappears one after the other. Consequently, atom's nucleus is generated from infinite elementary motions. Atoms' motions lead to formation of molecules then molecules' movements cause the creation of the material part of the universe. Accordingly, we can say:

**The material world is made up of "motion".**

On the other hand, the modern physics prove that matter is composed of condensed wave which is known as motion. Thus, both material and energetic perspective indicate that the universe is created by waves. As earlier mentioned, waves are originated from motion.

After above brief explanation, we can answer this question whether the universe has an existential truth or not. Thereby, since the material world is created from motion, different manifestations appearing in the universe are resulted from motion. Thereafter, each manifestation created by motion is virtual. So, the universe is also virtual and has no existential truth.

The above consequent leads man to ask this question what factor gives direction to these infinite motions which create such an organized and purposeful system. The answer is that there is an intelligent factor which identifies a motion's direction and creates a manifestation. Ultimately, this factor is capable of creating such a harmonious, purposeful and self-evidential system. Therefore, matter and energy, in other words, structure of the universe is made up of Consciousness, Intelligence and Awareness. So:

**The material universe is created from Intelligence or Consciousness.**

Humans can come to an agreement and establish a common idea based on the intelligence and consciousness governing the universe. Thereby, they can find out that the owner of this consciousness is God who becomes common point of humans' beliefs. Therefore, the common and fundamental ideology among humans is attributed to the intelligence/consciousness governing the universe or divine intelligence. According to this ideology, the common agent is known as **Interuniversal consciousness network**.

In brief, the material universe is originated from motion. Thus, different manifestations created in the universe result from motion. Since each manifestation resulted from the motion is virtual, the material universe is also virtual. Each motion requires a stimulus and a director agent. This agent refers to an awareness or a consciousness governing the universe which is named Interuniversal

consciousness network. Therefore, the universe is a virtual image of another truth that is created from an awareness.

Whereas the consciousness governing the universe is itself created and controlled from another source, this ultimate source is God who is the owner of this consciousness.

### **\_ Matter, Energy and Awareness**

According to the above explanation, there are three elements in the material universe:

\_ Awareness

\_ Energy

\_ Matter

For instance, man cannot apply matter and energy without being awareness. In other words, man is capable of exploiting matter and energy when he gains proper knowledge and awareness about these two elements. So, the major structure of the material universe consists of intelligence and awareness which form matter and energy.

Figure 2-9

As figure 2-9 illustrates, each of the above elements are convertible. The conversion of consciousness to matter and energy has been

briefly explained while the conversion of matter and energy into consciousness requires an inclusive discussion.

Figure 2-10 examines the elements formed the universe in detail. In other words, this figure illustrates that all elements of the universe simultaneously exist close together.

Figure2-10

Therefore, energy is formed in a consciousness field which is the important part of the universe. So, the material universe is only composed of one dimension and other different dimensions such as fourth dimension or time come into existence in the consciousness field. These different dimensions are formed and created in the consciousness field in which each dimension becomes meaningful.

Consequently, the material universe is proven as a virtual entity that is similar to an image in a mirror. Thereby, this image has no external existence. Now, we study the universe from other perspective:

## **\_ The World Visual Image Based on Velocity of the Observer**

Suppose that an observer is rapidly moving in the space. As the observer gets closer to or moving away from a sound or light source, the frequency and wavelength of the sound or light change. For example, when a person gets closer to a source of sound, the wavelength of the sound gets compressed and becomes shorter. Therefore, the frequency of the sound increases and it is heard at a higher pitch (figure.2-11). In contrast, if he gets farther from the source, the wavelength becomes decompressed and the frequency decreases. So, we heard a lower pitched sound or bass (Doppler Effect). The same is held in a light sound, too. So, the frequency changes while we got closer to or farther from the light source. Therefore, the color of light and its appearance changes.

We see the vision of the universe like the present form because we are moving with a nearly constant velocity through the space. Since Earth is a part of the Solar system, it rotates around itself and the sun in a nearly constant velocity. The Solar system locates in one of the arms of the Milky Way galaxy and rotates with a certain velocity. This galaxy, itself, rotates around another center with a certain speed through space. After all, our perceived view (in regards to appearance and different color ranges) is based on the ultimate velocity of our movement within space. Thus, if man were to live in another galaxy, he would possibly see different color ranges and appearance of the world.

Therefore, the material universe has no steady and main appearance so that its view depends on speed of the observer. Whereas the observer can have infinite different velocity, there are infinite views of the universe for each observer.

## **\_ The World Visual Image Based on the Observer's Eye's Frequency**

Each observer looks at the universe from his own eyes. The human can perceive the images in a particular frequency across his vision. Thereby, human eye sees 24 images per a second; human eye's frequency is 24 Hz. When we see 24 images per second in front of our eyes, we see it continuously. If the numbers of images are less than 24 pixels per second, we will see the view in an interrupted and non-continuous state. The more picture-motion speeds up, the more scenery seems to move abnormally fast (in cinematography). Thus, at the higher speeds, the frames would become unrecognizable. So, man sees the scenery of the world according to his eye frequency otherwise human would see the world in a different form.

You consider an eagle with the eye frequency of 20000 that is totally different from human eye sight. Eagles can follow the movements of a mosquito with full concentration in every second whereas human is not able to do this. Moreover, eagles can see the rain as "drop by drop" while human observes it falling as linear. In other hand, the frequency of a snail's eye is 5 Hz. For example, when we are moving, the snail sees a trail of several meters long behind us (figure2-13). A snail can see us when we completely stop.

Consequently, in terms of frequency, there are infinite scenery of the universe that are differently viewed according to the range of vision frequency. Thereby, the universe has no constant scenery so the universe is virtual.

In brief, the material universe is lack of fixed form and view. We see the vision of the universe like the present form because we are moving with a nearly constant velocity through space. Each person's eye is designed in a way to reflect the universe as a particular figure

to his owner. Thus, a person perceives a virtual image resulted from the particles' motions.

### **\_ The World Visual Image in Observer's Perceptual Threshold**

Each observer sees the universe in different form in accordance to his physical perceptual threshold. For example, the scenery of the universe is different in a snake's vision because snakes' perceptual threshold is different from humans' one. For example, snakes are capable of seeing Infra-Red light so they have very acute eyesight at nights. Thus, darkness is almost meaningless for snakes so that day or night does not make a real difference. Moreover, they are capable of seeing the temperature of objects and the living beings. What snakes see as the world is not the same that humans see. Therefore, description of snakes about the universe is severe different compared to human's view.

Similarly, the universe is differently seen from a bat's vision like a sonographic map. Bats are capable of echolocation within the specific frequency ranges. Thus, bats can distinguish objects up to a limited frequency range by emitting a series of quite loud ultrasound. Therefore, bats see the universe in a limited range which cannot be infinite.

There are diverse visions of the universe from various living species including a tiny microorganism or the biggest one. From this standpoint, the universe is also seen within various views so that each observer sees the universe in accordance to the physical sensors thereof. None of these created scenery is true but all visions appeared in the universe are virtual. In few words, every observer describes the universe due to his physical perceptual threshold. Thus, the universe has infinite sceneries.

## **The Final Conclusion about the Virtual World**

Referring to all above brief discussion, the universe is virtual from each angle we look at it compared to whatever is hidden behind the virtual world. In fact, there are infinite illusions embedded in the other illusions' hearts.

Yet, why is the universe created virtual? Being the virtual universe is a sign of extraordinary creativity of its creator. Although the virtual world does not have external existence, it is the carrier of a great truth. Thus, man passes through this virtual universe to achieve perfection. Moreover, the existence of the virtual universe rejects the notion/concept of God's dependence to the creation. Therefore, considering the universe does not have external existence, there would be no evidence to prove God needs to creation of the universe.

## **Mono-Form Universe**

### **Principle of Formational Unity**

The material universe is created from **consciousness or awareness**. The consciousness creates the primary motion and gives direction to the motion. Space and time are created by the primary motion afterward energy is originated. Energy in turn causes further changes in space and time. Energy is divided into general categories: **"compressed and decompressed"**.

It is worthy of note that energy is essentially frequency and motion. As earlier mentioned, the consciousness and intelligence governing the universe manage and direct each motion. So, energy is formed in the consciousness field so that no form of energy can exist without being of such field. Thus, the material universe has only one dimension. All different dimensions such as tri-dimensional space

and fourth dimension (time) becomes meaningful in the consciousness field; indeed, these dimensions are formed and created in the consciousness field.

There are factors causing changes in form and nature of energy that are known as compressed and decompressed factors. These factors produced changes that led to formation of the universe. Thereby, a phase difference is created in each part based on the amount of compression so that makes succession (succession in space and succession in time). The phase difference is originated from (different degrees of) Energy compression that causes space curvatures and circular currents. These circular currents act similar to whirlwind which is known as Cosmic Whirlwinds.

Space spreads out more in an environment in which energy is the least compressed thus perception of time lessens and vice versa. So, space and time have an inverse ratio with each other. The more velocity increases, the shorter time is felt. The more some accumulated energy becomes compressed, the less accumulated energy gets speed. Thereby, a lack of equilibrium is made in the adjacent space so that leads to occur whirlwind current.

Consequently, this phenomenon causes formation of the celestial bodies and galaxies. Energy becomes more condensed in the center of such masses. Energy compression is the maximum amount at which energy retransfers to its anti-energy. When energy attains the minimum amount of compression, the process becomes reversed and shifts toward being condensation. This cycle is repeated more and more.

Minimum energy compression ←—Energy—→ Maximum compression

Therefore, space-time dimensions are variable and the universe is placed in a repetitive cycle of contraction and expansion. Every

contraction ends by a big explosion (Big Bang) so that this explosion is the beginning of expansion for the next cycle. Thus, lots of Big Bangs have already occurred. Now, the Earth begins expanding and decompressing then in the most diluted state becomes contraction. Thereafter, the contracted Earth is turned into its anti-formation that creates another great Big Bang. The great Big Bang which forms the present cosmos. Upon the end of each expansion, all energies reach the most diluted level and vice versa. Before occurring the Big Bang, all energies of the existence are converted into compressed energy of " Enormous Black Hole". By approaching the level of "Critical condensed energy", at a once the energy's level commences shifting to the "Critical diluted energy". Therefore, the Big Bang initially occurs then the phenomenon of the expansion of the universe is formed. As the boundaries of this explosion spread out, space and time go through necessary changes.

This phenomenon demonstrates that space had never been at the present scale before occurring the Big Bang. Indeed, there was no such vast space in front of our eyes before the Big Bang. Since time is in a reverse proportion with time, time goes by faster in such situation (Critical time).

When mass of energy slows down, energy becomes compressed and vice versa. Thereby, energy compression reaches minimum level at the light speed so the mass of matter becomes equal to zero. In fact, the mass is equal to the amount of energy compression; so at the minimum energy compression, matter becomes equal to zero. Any object's motion at high speeds (some tenth of light speed or more) encounters a barrier which is named " light barrier"(like sound barrier). This wall is originated by compressing the wave which gains a frequency equal to infinity. If this theory is true, no object is able to pass through this wall. For passing through this wall, one needs

infinite amount of energy so that the mass of energy approaches toward infinity due to this resistance. Therefore, it is only the decompressed form of energy which is able to pass at the speed of light.

### **Virtual Universe from another outlook**

In the world of science and the modern physics, it is an observer who can determine structure of the universe whether energy appears as wave or as particles. According to the classical physics (Newton's view), the universe is an absolute reality which holds its own independent form, shape and nature without being an observer. Thereby, the universe continues to go without the assistance of anyone. Thus, no one's eyes have role in holding the universe together or making the scenery of the universe. Nevertheless, the modern physics says that an observer can specify the appearance of reality. Moreover, he can determine whether the universe appears as wave or as a composition of particles. According to this theory, no one may simultaneously see the world in both forms of wave and particle. Thus, the observer can interpret the universe in two forms of truth and virtual.

As earlier mentioned, the material universe is built on the motion. This intelligent motion is formed the universe based on the laws governing the universe. These laws originate the numbers.

God → Consciousness → Laws → Numbers

God creates the consciousness and the laws governing the universe come into being from the consciousness. Thus, God's will and permission governs the universe so that no leaf falls from a tree without God's will. God's will and permission is applied to the laws

which produce numbers. in other words, the universe is built up based on the numbers.

There are constant and variable numbers which determine how the universe and its contents are originated. The constant numbers include number of the light speed, Planck constant, constant number of Pi, Napierian constant, Avogadro constant number. The variable numbers include the number of distance between Earth and the sun, acceleration of gravity. Consequently, human beings can live on the Earth. Thereby, a slight minor change in each of the above numbers brings different conditions in the universe.

By realizing the role of motion in creating the universe, man understands that everything originated from motion is virtual. Thus, the universe is virtual, too. It is considered that if this virtual existence is put aside, the true existence comes into view/ appears.

Man looks like someone who is asleep that lives in a dream and imagination. He awakens when this curtain of illusion falls down and he understands nothing has been truth. Indeed, man is drowned in virtual world and misled by illusion. Thus, he is affected by virtual world instead of the truth.

When the truth is discussed, man should clarify which level of truth is considered. For example, an individual who stands in front of a mirror is a truth but his image in the mirror is a virtual. Nevertheless, he, the mirror and the entire universe are virtual compared to cosmic intelligence (consciousness). When the cosmic intelligence is compared with the superior level (God), the cosmic intelligence is virtual and God is absolute truth.

Truth/ Virtual= Me/ My Image in the Mirror= the Cosmic Intelligence/the Universe=God/Cosmic Intelligence

## The Universe in the Age of Intelligence

Man has now entered an age which is named the age of intelligence. In this age, man is anticipated that can accurately examine and apply the intelligence governing the universe. The evolution of man's thoughts occurs throughout the history that can be understood in a glance.

By tracing man's historical movements, he reaches understanding of the universe, gaining knowledge and moving towards perfection. Indeed, he ascends a ladder of development (figure. 2-14) and passes different stages. This figure shows his mental development in three general stages. In the beginning of the creation, human being had a man-like life and had no knowledge about him and the universe. After billions years, he passed the primitive stage and entered the humanity stage at which could fulfil his basic needs such as clothing and housing. Moreover, he developed his mental ability so that could discover numbers. He measured, numbered and expressed the reality surrounding himself thus identified the realities around him. Therefore, man took his primary pace in order to explaining and recording quantitative realities of the universe.

Figure 2-14. The stages of man's historical movement toward understanding the universe, gaining knowledge and moving toward perfection

Since the numbers play main role in originating the universe, man begins to discover different numbers. If there were the tiniest/ slightest difference in the defined numbers in the creation, the world would be a very different place. Thus, nobody exists in the universe or he might be located in other place. For example, if the constant speed of light was not 300000 kilometers per second, no man exists in this world. Moreover, the universe might not have the current form and structure. If we assume that the Earth-Sun distance would change, no man would certainly exist on the Earth or he could own a different body.

Human being is a product of a billion explosions, crashing the celestial bodies together, smelting and cooling. None of these phenomena seems to occur by coincidence while a constant number causes to exist each of these cases. Thereby, all phenomena have sequentially formed in the universe. For example, a star is born when a dying star transforms into a black hole then occurs an explosion. Afterwards, the Supernova is formed that is a rebirth in the universe.

Furthermore, there are different numbers which play a crucial role in creation of these phenomena. Thereby, each of the above occurrences is formed via the effects of these numbers in the universe. They are the critical numbers which determine definitive quantities in formation of a phenomenon. Thus, this occurrence does not seem to be by accident but there is a critical number which determines the amount of density of a black hole.

The cosmos is predetermined by an accurate plan which has early been recorded. Thus, everything goes on in accordance to an organized plan which indicates each number is early placed in heart

of each occurrence. Thereby, the universe has identity and direction so that its path is designed too careful to be imaginable for man.

The cosmos is formed by a great Big Bang then the Earth is shaped by combination of molecules which as detectors give birth to the existence. The universe exposes the existence/beings to the vital force via the invisible transformers. Ultimately, mankind comes into the existence. So, the origin of the life refers to a great Big Bang. Moreover, any alteration in the numbers governing the universe would make different indefinite dipolar worlds in which different conditions could exist.

Over the past centuries, discovery of the fundamental numbers leads man to develop his mental faculty in a new stage. He also discovers that there is another agent behind discovery of the numbers. This agent identifies amount of the numbers that is applied to the laws governing the material world. In other words, the laws create the numbers which result in formation of the current universe. After achieving this main discovery, man begins to define the universe by aid of laws (including the laws of physics and chemistry). Moreover, he attains this outstanding consideration by which the will of God is the same numbers governing the universe.

By passing the stage of discovery the laws, the present age exposes man to another marvelous finding. He begins to understand there is an extraordinary agent by which the laws governing the universe are imposed and managed. This agent refers to the intelligence embedding all components of the cosmos. Thus, this intelligence is named Interuniversal Consciousness Network.

Psychometry approach pursues to experience the effects of the consciousness upon the existence in practice. Thereby, the recent experiments lead man to step in a new stage at which he achieves

the intellectual evolutions. So, he attempts to view the creation and think about it from another outlook. To recognize this stage broadly, man deeply tends to know the origin and owner of this intelligence hence he understands the creation philosophy so more. Thus, man begins approaching the other part of his mental development (accessing to qualitative recognition of the universe or cosmos). In other words, man becomes familiar to the consciousness governing the universe in practice through this stage.

## **Relations of Components of the Universe**

### **\_ The Laws of the Intelligence Governing the Universe**

\_ The material world is made up of the intelligence so all constitutes and particles of the universe have intelligence.

\_ Intelligence is neither Matter nor Energy while both matter and energy has originated from the intelligence. Consequently, none of definition of matter and energy implies to the intelligence. Thus, the intelligence is neither wave (frequency) nor particle without any quantity and gender identity. No graphical diagram can be illustrated to represent the intelligence. The intelligence is only a function of quality.

\_ The intelligence is lack of time-space dimension so that transferring the intelligence does not need time. Moreover, the intelligence is not a function of space.

\_ Whole intelligence determines the intelligence of components.

\_ All components of the universe are affected by the intelligence so a component influences on the other.

\_ Component's intelligence impacts the other one via issuing its radiation in the universe. The intelligent radiations have no chemical

and physical effects. Thereby, the intelligent radiations only leave the intelligent effects on each component.

\_ The intelligence of a collection of components is considered as the whole or collective intelligence of the set. Thereby, the component's intelligence is affected by its whole intelligence. Furthermore, the whole intelligence determines direction of its component's motion.

\_ Partial intelligence embeds the data stored in the whole intelligence.

### **\_ Ratio of Partial Intelligence to the Whole intelligence**

Nowadays, man produces a tiny little device named flash memory in which many libraries' information are stored. Technology makes our world possible to access all man's writings throughout the history in this tiny little device in a short time. Thus, all global information including the data of companies, banks and properties will be available in the flash memories. So, it is not unexpected to hear that each particle of the universe is a flash memory in which all intelligent data of the universe are stored. In fact, there is a principle known as the parallelism of the existence data. This principle indicates that the intelligence is not quantitative as well as the partial intelligence is equal to the whole intelligence of the universe.

There is a question: what is the relationship between the partial intelligence and the whole intelligence of the material world? And why are these two intelligences equal together? The partial intelligence is equal to the whole intelligence because the intelligence is not quantitative. So, the intelligence of a particle is equal to the intelligence of the whole universe. In other words, the relationship of the partial intelligence is equivalent to the whole

intelligence. Consequently, the data of the whole universe exists in a particle.

**The Partial Intelligence= The Whole Intelligence of Material World**

**The Data Stored in a Particle= The Data of Entire Material World**

**Microcosmic= Macrocosmic**

Therefore, the world inserted in an atom enjoys the same dignity of the whole universe. A cell is made up of numerous molecules in which lots of atoms exist. An atom contains infinite tiny particles which act as the base flash memories. Thus, a cell can carry multiple data stored in the universe.

The seeds of lentil and wheat do not receive their data from the soil or water but these seeds are themselves equivalent to all data of the universe. There is the data related to the previous information stored in these two seeds such as the data of living species' common traits, the data of origin of the life.

According to this perspective, the data stored in a cell in regard to/related to life is divided into:

- 1: Data Related to the Cell (including programs of the cell's function, trouble shooting of the cell and the cell's recovery)
- 2: The data of an organ and cell thereof
- 3: The data of a body and cell thereof
- 4: The data of human beings and previous generations thereof (Gene)
- 5: The data of all beings (human beings, plants and animals)
- 6: The data of shared life of all species (the embryonic stage)

7: The data of the life formation

## **Role of Intelligent Relations in Living Beings**

### **\_ Separation of a Particle from its Whole**

There are differences between the behaviors made by a particle inside a complex and the same particle's behavior outside of its complex. This principle is certainty in regard to all particles of all available complex in the universe. A cell of the body exerts a definite behavior in its place while the cell fulfils a different behavior after separating from its tissue. Thereby, there is a functional alteration in the separated cell. Thus, function of a cell should be examined in its place because the cell's reaction in new condition is not the same executed in vicinity of other cells.

Each particle of the universe carries an existential code which acts similar to a certain barcode attached to the trade goods. Thus, each particle represents an appropriate behavior in accordance to its barcode defined in a particular complex. For example, a liver's cell fulfils an appropriate task which is different from the same outside of the liver. Therefore, this cell carries an existential code which changes when the cell separates from its complex thereof.

Thus, reduction of the cell in its place differs from reduction of the same cell outside of its place. In other words, existential code of each particle is hold in joining to other particles of the same complex which have healthy intelligence. Moreover, the reduction of each particle depends on the reduction of entire complex. Therefore, the life span of a particle decreases after separating from its complex.

### **\_ Adaptation/Harmony of the Consciousness**

A living being is characterized by adjustment of the consciousness existing between two living beings. For example, pathogenic

microorganism can be affected by the consciousness of whole the body. Yet, although this microorganism is activated in the individual's body, the microorganism is not harmful for the individual's health. Therefore, some individuals who are the carrier of diseases such as HIV virus, Tuberculosis, Hepatitis do not become sick.

Suppose that the body acts similar to a car so that its organs is physiologically affected by the pathogenic microorganisms. It is anticipated that these microorganisms have the same effect on all organs of the body. Moreover, it is expected that those who keep animals in their environment become sick while most of these people suffer no diseases. Thereby, there are a common and consciousness adaptation and harmony between the pet's microorganisms and the pet's owner. This adaptation leads the microorganisms to be held in an adjusted state in the individual's body. Thus, no microorganism is allowed to be activated in the body. Furthermore, some people who eat the foods discarded in a garbage (a source of pollution) do not become sick.

There are some people who are immune to many pathogenic microorganisms because they vaccinate against these microorganisms. Nevertheless, some other people are immune in result of adaptation of consciousness which is known as "consciousness immunity".

There are factors such as distress and worry which may disturb the adaptation of consciousness. Thereby, an individual who eats food in a high-quality restaurant may even become sick.

Lack of the consciousness adaptation as well as activating pathogenic microorganisms in the body may be characterized via a fever appearing after hearing an unpleasant event. The fever demonstrates that consciousness system of the body is disturbed in a

while so the body suffers a type of consciousness conflict. Thus, the microorganisms which have peaceful coexistence with cells of the body make problems.

There is another factor in disturbing the consciousness adaptation which refers to feeling fear of disease. An individual who feels fear of disease experiences the consciousness conflict with microorganisms creating the disease. There is another example which indicates importance of consciousness adaptation: in organ transplantation, the severe fear of surgical operations and the mental complications makes the consciousness conflict in the body. Thus, the transplanted organ (such as kidney) may get rejected because of the consciousness disorder. Yet, the transplanted organ recognizes the new location when the consciousness adaptation is established. So, the transplantation will be successful.

In some instances, the graft is taken from one part of an individual's body and transplanted elsewhere in the same individual. For example, in an open-heart operation, the body may reject the graft because of the disturbances of the consciousness. Thereby, the recipient's body cannot recognize the new organ. This conflict or disturbance of the consciousness may decrease via establishing the adaptation of the consciousness.

## **Data**

There is a substantial matter that data is obtained from the consciousness. Indeed, there is a new relationship: relationship between the consciousness and data (figure.2-15).

What is the sun in a glance? The sun is a luminous mass that there is the consciousness standing behind it. The consciousness is visible in the form of data and information. In other words, the sun is a set of

information or a package of data that transfers data to man through its nuclear fusions. For example, four atoms of hydrogens form helium through a fusion process then other data is obtained.

In the book of existence, all information is written in different forms of data packages and man accesses the packages. Indeed, as man uses different languages for programming and offering data, the creation is also engineered by data stored in galaxies, celestial bodies and humans.

Figure2-15

Therefore, there are different data and information stored in all items of the universe including particles, parts and the whole of the universe. In fact, there is a flash memory in which all data of entire the universe is stored.

### **Cosmic Internet**

According to Faradarmani and Psymatology's approach, human being is supported by a cosmic internet (Interuniversal Consciousness Network) which is managed by the Exulted Creator. The Exulted Creator provides man with infinite capabilities in the factory of creation, though he/she may not be aware of these capabilities. Thereby, after linking to this production factory via the cosmic internet, he can activate his pre-installed abilities and discover more of himself.

In fact, man is part of the universe that becomes meaningful only in relation to the whole. He is like a user of the internet that can apply his prepared capabilities in the creation factory. Thus, he can certainly discover and manifest his designed capabilities by linking to the cosmic internet. Figure 2-16 demonstrates that the user can access his existential catalogue designed in the creation factory by connecting to the cosmic internet. Thereafter, he can use this catalogue to achieve self-cognition. Moreover, he can apply the facilities of this internet network to cure himself or others. Treatment and recovery consist of every available program in the cosmic internet including trouble shooting, recovering and repairing the defective cell and its related organ. The software programs of all universal particles exist in this magnificent internet; it is called Interuniversal Consciousness Network. The cosmic internet has similar impact on the cells of different organisms; it even has similar effects on the molecules of these cells.

Figure 2-16

The purpose of two Iranian complementary medicines, Faradarmani and Psymatology is connecting “the beings” to the cosmic internet. In the process of these two doctrines, a sick man, animal or plant connects to this internet and receives the programs of troubleshooting and repairing for treatment. In this process, a man can treat an animal and/or a plant by using the facilities of the cosmic internet. This experimental evidence attributed to Interuniversal Consciousness Network demonstrates that the cosmos is united, alive and purposeful.

### **Theory of Consciousness Bond**

Faradarmani and Psymatology are founded on the basis of the theory of consciousness bond or the particles' shared consciousness. According to this theory, by establishing a link between the Whole Consciousness and Human Beings' Constituents Consciousness, the Body's and Cell's Management Consciousness begin to correct, repair and improve the defective part. Moreover, the deficient functions of psyche's software and other parts of the mind are corrected; thereafter healing and recovery takes place. The constituents' consciousness consists of the infinite numbers of man's existential parts and the whole consciousness consists of the consciousness and the intelligence governing the universe. By linking the constituents' consciousness and the whole consciousness, the consciousness bond circle is formed. Thereafter, the consciousness distribution management center of the mind is developed and is linked to all parts of the body. Thereby, all parts of the body are scanned and improved (figure 2-17).

Figure 2-17. The Consciousness Bond

## \_ Scanning

In the scanning process via the Consciousness Bond, a patient's body is placed under a magnifying glass, so that his/her apparent and hidden diseases and disorders are exposed. The patient becomes connected to the Interuniversal Consciousness. Following this procedure, the patient automatically undergoes the Scanning

process by which all his diseases are revealed. Thereafter, the stage of discharge begins and the symptoms of diseases are manifested in accordance to the obvious diagrams. The term "Discharge" refers to a process in which the signs and symptoms of cell's problems are revealed. In this stage, all apparent and hidden signs of the diseases may be detected and then the recovery process is initiated.

Man's body is made up of numerous molecules and micro-particles which are composed of the vibrant strings as well as all particles of the universe. These vibrant strings form the material part of the body. The Consciousness governing the universe creates and directs this vibrancy and motion. Thus, all micro-particles and human existence have a close connection to the consciousness of the universe. By accumulating the constituent's consciousness, the whole consciousness is produced. The whole consciousness (Interuniversal Consciousness Network) is the consciousness and awareness governing the universe that is a fundamental element of the universe. Consequently, human beings can only achieve their purpose via the connection and the bond to the whole consciousness. According to the theory "Faradarmani" and "Psymentology", one of these purposes is self-troubleshooting and self-treatment

## **\_ Connection**

In Faradarmani and Psymentology, the Connection refers to establishment of links to Interuniversal Consciousness Network (ICN). This type of connection has no accurate definition because the connection is attributed to the world that is "free of devices". Since the connection is an empirical occurrence, man only comprehends and observes the effects arisen from this linkage. So, establishing the connection is performed at a glance to the Consciousness Network

so that a link is formed between the particle's consciousness and the whole. Thereafter, this consciousness bond has the successful outcomes.

### **The Consciousness Levels**

The tiniest constituents of an atom are composed of the fundamental waves or the elementary vibrations. The consciousness of fundamental vibration is the earliest kind of wisdom which exists in each inanimate object. The fundamental vibration produces strings which possess consciousness. The strings create the particles and anti-particles which produce electron, proton and neutron. Thereafter, the atom forms.

Constituents of each particle have a consciousness related to itself and it follows a great purpose. The consciousness of each particle and the consciousness of tiny and big constituents of the universe is called the consciousness of base. Each animate object is developed by adding an advanced wisdom (more capabilities) to its consciousness of base; that is known as the consciousness of life. Thereby, a single-celled organism has a superior consciousness compared to even the biggest inanimate/non-living beings. The common wisdom develops and becomes the instincts. Instincts are a superior type of common wisdom. The instinct is placed in the advanced living beings which have the organized and predetermined inner reactions. Thus, the consciousness of instinct is placed beside the consciousness of base and the consciousness of life.

There is an upper level of consciousness that is controlled by conscious choice of each living being. This level is attributed to a type of wisdom named "the consciousness of will free or voluntary wisdom" that is added to other types of the consciousness. Yet, the voluntary wisdom does not differentiate human beings from the

other beings; the non-organic type A also enjoys this kind of wisdom. Love merely separates human beings from the other beings of the universe.

Love and the outcomes thereof do not follow the laws of logic; but love can subdue the logic. Love is the dynamic soul of the universe that is placed above the logic. Human beings reach the superior understanding by accessing the facilities available on the step of love; while the step of logic cannot prepare these facilities for man. The logic software is activated after the birth, but man attains the qualified development on the step of love.

### **Theory of the Communal Mind**

The ecosystem is a single-body/unified body and all its components are interrelated. Man can access each available data file of the mind via the man's communal mind after connecting to the cosmic internet. Therefore, the correction, improvement and recovery is executed by the discretion of ICN (figure.2-18).

### **Theory of Human Beings' Existential Capabilities Related to Consciousness Governing the Universe**

#### **1. Activating the Man's Capabilities (switching on the off keys)**

Human beings possess numerous capabilities including physiological, emotional, cognitive and other activities which seem to be inaccessible. At the present, man is using a tiny portion of his pre-installed capacities. Applying each capability becomes possible when the capabilities are switched on.

The brain is the connector of different parts of the body: the mind, psyche and physique. The brain translates the data

which man perceives. For example, composing poetry and music is detected via brain's functioning. Brain detects the mental comprehensions and emotional expressions by translating them into the physical language. For example, if the emotional area in the brain is damaged, this damage causes impairment to the man's psychological emotions. Thus, he has no emotions such as happiness and sorrow, because the brain cannot properly translate the input data.

The range of man's perceptions can be excessively developed so that he discovers all hidden information of the universe. As long as human beings begin to switch on all keys related to the truths of the universe, all inactivated keys are turned on in the brain. Today, scientists believe that man is only using a small part of his brain's keys, but the truth is that so small amount of his brain's switches are currently activated.

Human being is designed so that he can access all data of the universe and then perceive those data.

Unfortunately, he has only activated a small portion of his brain's capabilities. By activating these capabilities, he can make numerous improvements and corrections. For example, man can improve/ correct his sleep pattern; thereafter he can program this pattern. Nevertheless, the medical science has no sufficient knowledge about the adjustment of time and quality of sleep pattern.

Man should penetrate his existential treasure and identify his hidden capabilities. He can execute the activation of his capabilities via connecting to the Intelligence and Consciousness governing the universe. For example, an ordinary individual cannot feel and apply the cosmic force, but he can certainly feel this force by activating the switches related to the cosmic force via the Interuniversal Consciousness.

## **2. The Man's Existential Catalogue and Connecting to the Cosmic Internet**

If the man's existence is compared to a machine, this machine has a catalogue for a proper and efficient utilization. So, this catalogue should be studied, otherwise the machine gets damaged. Moreover, after the precise examination, the individual may not consider himself the cause of the problem; instead he blames the production factory.

In other words, since each machine is introduced by a catalogue, a customer should precisely study the catalogue to become informed about the machine's capabilities. So, the customer learns to use the machine properly. So, if the product catalogue is not precisely studied, the product is damaged before even being used. Hence, the customer is responsible not the production factory.

Similarly, human being is seized by the complications if he cannot identify the capabilities designed in his existential catalogue. On the other hand, he tends to view life negatively and reach the conflict with God's word.

Suppose that man's existence is compared to a machine, he should properly read his existential catalogue to manage his existence.

Man's existence is like a complex machine that requires an exact programming in order to have an appropriate output. Man's existence is equipped with the certain codes which run different commands (depending on how they are applied). Thus, he cannot expect a correct operation without identifying these codes. In other words, to use the capabilities of human being's existence, an individual should access man's existential catalogue and become aware of the various constituents and their applications. This catalogue demonstrates the magnificence of man's existence and allows him to operate various and useful processing.

Divine Consciousness is similar to an internet named the Cosmic Internet. There are similarities between the applications of internet which is the global system of interconnected computer networks and the cosmic internet. One of these applications is the ability of accessing the production catalogue and using the various designed applications through different production factories. Today, the production catalogue is available online in the internet network. Thus, by linking to the factories' sites, an individual can be informed about the production catalogue. So, in the worldwide

participations, the products delivery expenditures are reduced.

There is another ability of the internet that updates each machine's software programs. Thus, this capability enables the machine to become programmable. By referring to the production factory site, this capability (updating) is activated. Nevertheless, the factory places initial programs in each machine. But an individual should refer to the factory site for accessing the advanced programs and for updating the programs.

The same system is prepared for human beings via the Creator and the production factory. In this system, some installed programs and capabilities are off, thus the man can switch them on by connecting to the site of the production factory. Therefore, everyone connects to the production factory via the cosmic internet in order to enhance his limited capabilities and abilities. He can switch on a set of his inactive capabilities by linking to the cosmic internet and then begin applying them (switching on his existential off keys).

Therefore, human beings possess a cosmic internet (Interuniversal Consciousness Network) and a site of the production factory (the Creator). Whereas he is not aware of many capabilities put in his existence, he should connect to the production factory. Subsequently, he identifies his limitless existential

programs in order to activate them and recognize more of himself.

In fact, human beings as a part of this universe is defined via the whole. He is similar to a user who can apply the stored facilities by connecting to the internet network. He has to connect to the cosmic internet to become capable of identifying and manifesting the designed capabilities in his existence. By linking to the cosmic internet, the user attempts to receive his existential catalogue from the production/creation factory site. Thereby, he can move towards the self-cognition, also he can use this network's facilities in order to treating himself and others.

### **3. Effects of Non-Physical Factors on Man's body**

Theory of accessing the man's existential catalogue (the existential plan) and connecting to the cosmic internet (Interuniversal Consciousness Network governing the universe) offers a question. The question is: can non-physical factors impress man's body? There are some answers for this question:

The received input from the physical receptors pass through the insight software (assessment and evaluation).

Thereafter, the data is carried to the perception software then to emotional software and eventually to the brain. The brain translates this processed data into the physical body and exert a specific reaction related to the data. For example, a lot of people are displeased in a cloudy day. The

evaluation/assessment software as well as the association software interferes in producing this type of reaction. The feeling of being displeased may appear when an individual remembers an unpleasant accident occurred in a cloudy day. Thus, the cloudy days remind him this accident and make him unhappy. Moreover, this feeling may refer to a mother's unpleasant feeling against an environmental condition. Thereby, mother's unpleasant perception is transferred to the shared mother-embryo software during pregnancy and then to her child's unconscious in childhood age. The collective soul software can also produce this unpleasant feeling. Thus, people of each small or big society demonstrate the reflection of dominant feeling of that society/each small or big society is affected by the people's dominant feeling reflected in the society. For example, people living in the rainy region have no pleasant feelings of the cloudy weather. They may be dissatisfied by seeing a cloud in the sky. Consequently, man's mental and psychological reactions depend on various software-based reasons.

Man's mind and psyche are affected by another software called Idealist self. Everyone has an idealistic software in his existence that leads him/her to feel unsatisfied in some conditions. As soon as he encounters the discontent conditions, his idealist software is activated and leads him to feel unhappy.

Therefore, there are various soft-wares which by assessing the events and conditions make the man's reactions. The outcome of the assessment passes to the mind in order to manifesting the mental perceptions. Thereafter, the mental perception is conveyed to the psyche for detecting the psychological feelings. Eventually, the processed data is transmitted to the brain so that the data is translated into the physical language. Thereby, one expresses his hatred in his facial expression/appearance and shows a gloomy face or he expresses his happiness with a smile on his mouth. The brain is an obedient. Thus, the physical reactions are resulted from the functions of various soft-wares installed in man's existence.

There is a management center in the body that controls the brain's function in translating the data. Nevertheless, this center's physiologic commands are not predictable/ the type of a physiological command issued from this center is not predictable. For example, an individual feels very tiredness after spending a hard day. But when this individual feels his child is at the risk, he suddenly stands up and runs toward his child. There is no physical/ medical reason for his motion's speed whereas his muscles become tired. In other words, there is a type of acid in the muscles that prevents the muscles movements in the tiredness state. Nonetheless, the mind and psyche recognize that this reaction is urgent and the disability is affected by this

recognition. The body is affected by the software and direct interference of cell and body's management in performing/exerting this quick motion.

An ordinary individual's physical energy is varied due to his psychological state. As he hears disliked words that make him unhappy, he is easily discharged. On contrary, when he feels pleasant, his physical energy is enhanced/ charged. In fact, the system which causes the cellular fuel is burnt/consumed or not is attributed to a software-based system not a physical one.

The cell and body's management software controls the physique so much as well as activating the body's microorganisms. Each disturbance and less activity of this management system leads to occur diseases arisen from microorganism. These microorganisms are defeated by the immune system of the body so that an individual's healthy is saved.

Consequently, the non-physical factors influence the functions of different parts of human being as well as his physical body. When the man identifies the relations of soft-wares designed in his existential plan, he can design his existential set-up. Thereby, he can determine the bright goals after referring to this plan. Therefore, he is capable of resolving every complication by recognizing the relationships among the constituents related to the defective part.

## **Theory of the Mental and Ultra-Mind Sensors**

In Psymtology perspective, there are three groups of sensors or detectors designed in man's existence that each group undertakes the specific role.

**1. The Physical Sensors (five senses):** this group transmits the input data to the brain.

**2. Mental Sensors:** Mental receptors transmit many of perceptions to physical part whereas physical part does not distinguish this transmission. For example, the light with 50 Hertz is constantly and frequently seen through the eyes' physical receptors while it is turning on and off 50 times per a second; and only the mental receptors distinguish this off and on. In other words, mental receptors are accurately and momentarily recording and registering outward events. Moreover, the mental receptors record all the environmental data even while man is sleeping. Therefore, these receptors examine different archives of mind and receive different perceptions. By activating/programming mental receptors, they can organize mind's archives such as removing wrong data, classifying and arranging the received data. It is required to mention that no information should be removed. According to law of common survival, nothing including of matter, energy and data are annihilated in the universe. The law of survival embeds either matter and energy or data and awareness. The data is not annihilated/destroyed but is continuously recorded and registered with its details.

**3. Ultra-Mind Sensors:** understanding and revealing the data, awareness and inspiration are achieved in the ultra-mind sensors. In other words, the ultra-mind sensors refer to the inspiration

receptors which are able to perceive the unrecognizable awareness by the mental sensors.

## **Theory of Sleep**

Humans averagely spend a third of their lives sleeping. An individual assumes that he has to sleep in order to relieving himself of tiredness. He believes that he is prepared for a new day's activities after a good night's sleep. Thereby, he sleeps to continue his best and effective efforts through the waking hours' working. It is not an exaggeration to be said that lots of people think of sleep in these terms. They never think that sleep could have other purposeful benefits. Moreover, although sleep takes up a third of life, but a well-qualified sleep can make possible an impossible survey in the material world.

As mentioned earlier, human beings have some kinds of perception thresholds that include:

**Physical Perception Threshold:** this threshold embeds all five senses of vision, hearing, smell, touch and taste. The physical perception threshold fulfils all man's physical affairs in awakening state. Nevertheless, these senses temporarily shut down during sleep. The range of this perception is limited so that cannot receive the perception beyond this limits.

**Mental Perception Threshold:** man accurately registers all events occurring around him via this threshold even if the events are beyond the physical perception. For example, when an individual looks at a car's license plate at a glance, he can never recall the car's number. Yet, he can recall the number through a hypnosis process. This number is obviously registered somewhere in his mind. Therefore, this number is received via the receptors.

**Ultra-Mind Perception Threshold:** man is equipped with the receptors which receive inspirations (mental spark) and whatever he has not thought of it. In Psymetology, these ultra-mind receptors which enable man to penetrate the data of the universe are called ultra-mind threshold. This threshold is beyond the time, place and language.

In Psymetology viewpoint, sleep is an opportunity for temporary deactivation of the physical perception threshold and activation of mental and ultra-mind perception thresholds. For example, dreaming occurs via the mental perception threshold while inspirations and new data received in sleep comes via the ultra-mind perception threshold.

The world is a learning place where man can enjoy the great treasure of the divine knowledge bestowed him. He can unite with God in next world. Using the divine knowledge treasure requires having a sufficient awareness in order to unveiling and applying the knowledge. A good and harmless/innocuous person is not the best one. For example, a student gets the best grade for discipline while his grades in dictation and math is not good. Yet, this student is not a successful one for his teachers even though he may morally be the best person in the world. Similarly, the man who is merely well-behaved while he has no knowledge about the philosophy of the creation is not the best for the Creator.

Therefore, human beings need to realize his status in the cosmological ecosystem so that discover the philosophy of his creation. He should comprehend the great plan of creation otherwise he cannot find out his identity in the universe. Thus, sleep is an opportunity by which the man's reality measuring receptors (physical perception threshold) are deactivated to his truth measuring

receptors are activated. Thereafter, he exposes to inspirations and understand the reason of creation more.

The man accomplishes his activity by moving towards survival in the awakening otherwise his survival is disturbed. Furthermore, sleep play a role in revival of strength and relieving tiredness. Moreover, in sleep process, the receptors of mental and ultra-mind perceptions are activated in order to receiving the data and knowledge related to the creation. Hence, sleep and awakening are the complementary process in man's life. The man is similar to a submarine come on the surface of water in awakening. The submarine gets supplies and the needed inquiries on the surface of the water thereafter it follows its main mission beneath the water. In other words, the main part of the man's life occurs in the sleep cycle. In Psymatology perspective, man's sleep is programmable that can be implemented in several stages and different levels:

\_ changing sleep pattern and exerting a plan of a colorful, clear and bright sleep

\_ making a purposeful, significant and continual sleep without something irrelevant

\_ making sleep purposefulness in order to receiving inspirational data related to the creation and the reasons of creation

### **Theory of Recovery**

One of the important theories in Faradarmani and Psymatology is the theory of abilities of recovering and correcting the different defective parts of the man's existence. According to this theory, each constituent of man's body is repaired. The phenomenon of cell and organ's recovery and correction occurs through the different ways:

1. The functional recovery/regeneration and correction of cell and organ
2. The histological recovery and correction of cell and organ
3. The morphological recovery and correction of cell and organ
4. The recovery of cell's and organ's atrophy
5. The recovery of cell's disability
6. The correction of molecular alteration
7. The correction of software programs

### **1. The Functional Recovery and Correction of Cell and Organ**

In mechanism of the functional disturbances of the heart, the organ's function is disturbed. Yet, no complication is observed at the organ's cellular level. In some cases, the function of cell may be disrupted afterwards another complication is produced such as the cellular overproduction (cancer) or vice versa. In Faradarmani and Psymtology process, the function of defective organ is corrected and the cell's function recovered.

### **2. The Histological Recovery and Correction of Cell and Organ**

Sometimes the recovery occurs in tissue such as regeneration of injured skeletal tissue arise from/caused by a bone-breaking, regeneration of injured cartilage tissue in arthritis, recovery of muscle tissue. Nevertheless, the medical studies indicate that regeneration process is possible in some tissues of the body. In these studies, the regenerations such as the recovery of spinal cord-brain damages and the recovery of necrotic tissue are impossible. Yet, the experiments demonstrate that all of these injuries are recovered through Faradarmani and Psymtology process.

### **3. The Morphological Recovery**

In this kind of recovery, abnormal form and size of an organ are repairable. For example, an enlarged heart or liver can be improved/recovered in Faradarmani and Psymatology approach

The experiments indicate that all of these disturbances are recovered and improved in Faradarmani. The injured cell is recovered by accessing/referring to the stored data therein. There are seven divisions of exclusive data in each cell. Thereby, by accessing the specific program of each data division and activating the program thereof, the injured cell can get a level of regeneration and correction. These levels include:

**Level 1:** Data Related to the Cell:

- \_ program of the cell's function
- \_ program of trouble shooting of the cell
- \_ program of the cell's recovery

**Level 2:** the data of an organ and cell thereof

**Level 3:** the data of a body and cell thereof

**Level 4:** the data of human beings and previous generations thereof (Gene)

**Level 5:** the data of all beings (human beings, plants and animals)

**Level 6:** the data of shared life of all species (the embryonic stage)

**Level 7:** the data of the life formation

In Faradarmani and Psymatology process, the erroneous data registered in different levels of a cell is improved. These levels are explained in following:

**Level 1:** This level of information embeds the cell's main data. This data of the cell is examined independent of its tissue's data. This level of data is classified to three groups:

\_ The program of cell's function which consists of programs and activities of cell in order to keeping its survival. Faradarmani and Psymatology medicines attempt to improve the cell's function and behavior through this level. For example, a cell may forget its normal duty at the result of exposing to external factors/agents such as carcinogen (substances causing cancer), harmful radiations. Thereby, these agents interfere in causing the abnormal cell growth/ overproduction (cancer), degeneration of cell growth/ cellular failure (atrophy) and other disturbed behaviors. Nevertheless, all of these cells regain their normal and main duties through Faradarmani and Psymatology process.

\_ The program of trouble-shooting of a cell is executed in the scanning stage of Faradrmani process. In this stage, symptoms of the cell's deficiency are exhibited thereafter the recovery and correction of functional program of the cell are initiated.

\_ The program of cell's recovery is applied in order to exerting the needed recoveries of the injured cell.

According to this experienced perspective, man can penetrate/pass into cell's data then activate the cell's specific data. Consequently, the cell is repaired and corrected (even recovery the brain's disorder and necrotic tissues).

**Level 2:** This level of information is attributed to an organ and the cells related it. For example, a cell of liver holds the data stored in the liver and the cells thereof. A cell may be affected by an abnormal condition so that its organ exposes to a risk such as metastatic

diseases and the consciousness replication. Faradarmani and Psymontology therapies improve the cell's erroneous data by adapting the cell's data with the general program stored in the organ.

**Level 3:** This level of cell's information consists of the information of a body embedding the cell. Thereby, each cell can recreate a body in which the cell is as soon as providing appropriate conditions for the cell's growth and proliferation. So, the cell holds all information of its complex. For example, an embryo can be created by proliferation of a single cell then a man is recreated.

**Level 4:** In this level of cell's information, the record of human being's creation is a significant phenomenon. Thereby, he is characterized as a thoughtful and self-awareness being in accordance to this record. Gene passes all good and evil records from the previous generations into the new one. In fact, the thousands years' data is registered in gene.

In the current medicine, diseases and complications which are genetically inherited and transmitted to the next generation are incurable. Nevertheless, Faradarmani and psymenotherapy approaches are capable of penetrating this level of cell's data. Thus, gene is not a barrier for curing all genetic diseases. According to the resulted experiments, by passing into the data related to the previous generation can overcome the genetic diseases. Therefore, in Faradarmani and Psymontology processes, treatment of all kinds of disorders and diseases are possible without leaving any negative effects. The theories of Faradarmani and Psymontology refuse this theory that gene can prevent the process of treatment.

**Level 5:** This level of information is shared among human beings, animals and plants; furthermore, the man's cell has the data related to plants and animals therein.

To access the shared data of all species, Faradatherapy and Psymenotherapy are possible in curing human beings, plants and animals that pursue the positive outcomes. Some species can repair their lost parts of the body such as the lizards which can regenerate their lost tails. By reaching the fifth level of cell's data, man is capable of regenerating his lost parts of the body.

**Level 6:** this level of cell's information refers to the stage in which a living being or beings exist. In this stage, human beings, animals and plants were not distinguished. This period of time is called the germinal period. Afterwards, this germinal period is pursued by the embryonic period. After the embryonic stage, the living beings are divided into the branches of human beings, plants and animals.

**Level 7:** This level refers to the data of creation of the life and production of the original germ cell. In other words, data and knowledge of the entire life exist in each cell; a cell holds the data of all plants, animals as well as life style, thinking and other soft-wares inside itself.

These theories will be gradually accepted in the world of science.

#### **4. The Recovery of Cell's Atrophy**

A cell is often exhausted thereafter it encounters the deficiencies in its function. The experiments gained in Faradatherapy and Psymenotherapy demonstrates that these two complementary medicines are capable of removing cell and organ's exhaustion/charging a cell and organ. For example, old people who suffer chronic weakness and atrophy after years are healed through

Faradartherapy and Psymenotherapy. Therefore, they feel strength and vividness in their life.

## **5. The Recovery of cell's disability**

A cell's function may get a reduction in the potential coefficient which is very important. This reduction shows that a cell's disability speeds up. The experiments resulted from Faradarmani and Psymenology demonstrate that this disabled cell can be activated. There are some reports of the damaged cell's activation such as recovery of necrotic tissues, pancreas activation in type 1 diabetes.

## **6. The Correction of Molecular Alteration**

Lots of diseases are not recovered via cellular correction such as the coronary artery clogging caused by fatty molecules and disturbances of urinary bladder, kidney, gallbladder caused by oxalate, urine and phosphate stones. There are other factors which cause disorders in the body; these disorders are cured by recovering the disturbances and clogging via molecular decomposition.

Therefore, in Faradarman and Psymenology processes, the disturber molecules are established in the consciousness field so that the molecules' behaviors are corrected. The behaviors of these molecules are affected by the consciousness field. To establish in the consciousness field, the damaged molecule's structure is changed thereafter decomposition of the defective molecule is initiated. In this process, the disturber molecule is separated and occurred the treatment. For example, in coronary artery clogging, the fatty molecules which cause the clogging are decomposed/separated from each other and the arteries are recovered.

## **7. The Correction of software programs**

Faradarmani and Psymetlogy are founded on the basis of this viewpoint that behind each cell and body's hardware exists a software part. Thereby, cell and body's functional programs are altered and corrected. In Faradarmani and Psymetlogy, recovery and correction of defective software are exerted in the consciousness field.

Each particle of the universe is affected by different fields including gravity, electromagnetic and the other fields. The particle manifests a specific behavior due to the specific field. One of these fields which is empirically recognized named the consciousness field. Each particle placed in this field is affected by its upper particle's consciousness; moreover, the particle's behavior in this field is different from its behavior in other fields. The theory contained this law is called theory of the consciousness field.

There are the behaviors exerted by each particle in the consciousness field including formability, decomposability and composability (repairing). Nevertheless, according to the theory of consciousness field, either a defective particle recovery or the process of software correction is affected by the consciousness field. The software programs of man's existence are improved in this field. Thereby, this improvement is implemented by reaching a consciousness adapted to new consciousness field. For example, the consciousness field is applied in correction of sleep pattern and recover from addiction.

Moreover, the main software programs which are available in the unconscious part prevent the current treatments. Thus, recovery process does not pass into the unconscious level and treatment

remains incomplete. Yet, the unconscious programs are improved in the consciousness field.

In a consciousness field, the software programs of man's existence are adapted and congruous with new consciousness field. One of the outcomes resulted from software compatibility in the consciousness field is " the consciousness immunity".

### **Vital Reactors**

Vital reactors transform/convert and flow vital force throughout the different parts of the body. These reactors are one of the mysteries in the world of science. These reactors are divided into the several groups:

**1. Sub-DNA Reactors:** these reactors create an area for DNA molecule to receive vital force from the matrix of the universe. Sub-DNA reactors transform DNA (composed of some nucleotides and dead molecules) to a living entity. Thus, DNA is a detector which makes the vital force usable in a cell via SubDNA reactors. For example, a bean seed in a desirable condition receives the vital force via SubDNA reactors so that the seed begins growing. According to this theory, a disabled cellular reactor of the necrotic tissue can be activated through this process.

**2. Bodies Reactors:** these reactors supply cosmic different forces for nourishing man's various bodies (the mental, psychological, astral and other bodies) via chakras (figure. 2-19).

**3. Organs' Reactors:** these reactors (fourteen blocked channels of the body) flow the cosmic force in the organs of the body. These reactors make a balance in the organs' functions throughout the body. So, the balance of the organ's cells related to the channel is

disrupted by any disturbances in path of these channels. Consequently, the organs suffer illnesses.

### **Theory of Four Energies and their functions**

In Psymtology viewpoint, there are lots of known energies flowing throughout the universe such as energies of fourteen channels and chakras. The energy management center determines which energy should be used and how apply it. Four types of energies are examined here:

#### **1. Energy Type 1 or Energy Gained from Nourishing (ATP):**

This type of energy is produced by consumed foods and physiologic process. The energy type 1 is consumed in the physical metabolism. All kinds of beings (human beings, animals and plants) need this type of energy (indirectly originates the vital force).

**2. Energy Type 2:** this type of energy does not produce by physical needs. Energy type 2 is generated from being praised, admired and adored by others. But this type of energy is lost by being blamed, denounced and disgraced by others. For example, consider an individual who is returning home from his day working hears a pleasant news. This person becomes too happy to forget his tiredness. But consider an individual who is very happy and energetic in the morning and hears an unpleasant comment about his appearance. This individual is discharged and feels tiredness and loss of energy. Pretense/exaggerated behavior is another samples for receiving the energy type2. For example, motorcyclists who perform stunts on the public roads need to attract people's attentions. Thus, this performance satisfies these motorcyclists. In an underdeveloped (anti-perfection) society, the people are nourished via gaining the energy type2.

**3. Energy Type 3:** there is another energy that is gained by practicing the charity affairs and spiritual acts. The man is satisfied by sharing in his desirable matters. Man is supported by the energy type 3 so that induces to move towards the perfectionism.

**4. Energy Type 4:** this energy is applied for other purposes. For example, consider that an individual is too tired to be discharged and cannot move after a hard day working. Yet, when he sees his child standing on the upper of a building, suddenly he can move his tired body and run to his child in order to rescuing. Thus, the individual's tired muscles which prevent his motion are quickly activated. Man's body is equipped with shortcut systems which are instantly activated. For example, the shortcut system can activate a paralyzed muscle. The inner energy can immediately flow through the defective muscle via this system. Suppose that in a running competition, a runner becomes too tired to continue the race. But he is charged at end of the race when he sees his child moving hands; thereafter the runner run faster.

Therefore, the above identifications provide man for saving these four energies and exerting proper utilization of these energies. There are lots of effects resulted from these energies; for example, energies type 2 and 3 can impact on the man' life span so that make his life increased or decreased. Thereby, reduction of cellular potential coefficient and life span are controlled by management of these energies specially the energy type 2 in order to preventing discharges.

### **Theory of the mental energy management**

There is a specific energy flowing through the body named the mental energy. Everyone spends his mental energy on thinking about different subjects. Some of the subjects need to be attended such as

thinking of resources of subsistence, housing and providing facilities for the children. But thinking about some unnecessary subjects burn the mental energy such as resolving the life conflicts, gossiping, assessing insignificant matters. Figures 2-20 and 2-21 are supposed drawings that examine the ratio of spending the mental energy for thinking of various subjects to thinking of the whole.

Figure 2-20. The Uncontrolled Mental Energy

Everyone may often focus on a specific subject so that this subject becomes the main axis of his thoughts. Therefore, when we visit the different people, we necessarily remind their significant subjects. For example, a person who continually seeks the wealth reminds us money while visiting a perfectionist reminds us perfection and superiority.

The people who avoid thinking of the unnecessary subjects or overemphasizing/overstating on the necessary matters save their mental energies. Thus, they are increasingly able to think of perfection. On the other hand, those who think more about perfection overcome their vain thoughts. Thereby, they make a

balance in thinking about the necessary subjects. In other words, the mental energy management cultivates the thought of perfection. Thought of perfection keeps away the individual from harmful thoughts and leads him to manage his mental energy. Therefore, he either becomes eager to comprehend the truth of the universe or enhances his connection to God and His manifestations in the universe. He significantly focuses on discovering the truths. When human existence is filled up with the divine love, his mind focus on perfection. Thus, he is able to manage his mental energy.

Figure 2-21. The Saved Mental Energy

### Insight and Recognition

Man exerts different reactions against the surrounding events. Moreover, his behavior and attitude are different in each condition. Everyone displays a specific and different reaction in the same event occurred in a society. Some of the wrong reactions may play important role in originating illnesses. One of the factors in emerging

diseases is man's functional manner which is arisen from his insight. The complications caused by the wrong insight are the diseases origins that is named the insight-rooted diseases.

For example, some people experiences heart attack or other diseases after hearing the news about downfall of gold or dollar's price in the stock market. This occurrence increasingly appears throughout the world. By considering this experience as a crucial problem in the world, what is the relationship between the downfall of gold or dollar's price and the heart function? Why some people are affected by this fluctuation? Why some individuals suffer diseases after hearing of their family's death? Nevertheless, there is scientifically no relationship between the events and the functions of different parts of the body. Indeed, why can the unpleasant news impact the man's mind, psyche and physique?

The erroneous insight is a factor in emerging diseases. Insight is man's interpretation of his surrounding events. In other words, all the personal understandings of environmental affects pass through the insight software. Thereby, the insight software is applied to a brief outcome of the mental and emotional reactions that automatically determines man's emotional response to an event (figure.2-22). This framework is a preprogrammed filter which is placed in the subconscious part. Thus, the insight software is consciously programmed due to an individual's understanding of the analysis. Yet, the program is unconsciously revealed thus this is considered as a subconscious program. Consequently, the insight software programs compared to the other unconscious programs can be consciously changed into a desirable program.

Figure 2-22. The Insight Filter

### Theory of the Adaptation of Bodies

Man needs to make a balance among his mind, psyche and physique thus he can exert a proper behavior in his life. This balance occurs by making a coordination among the mental, emotional and physical bodies. Lack of adaptation and incoordination of the bodies cause the disruption in man's existence. This disruption pursues the outcomes that the instant sanity is one of these outcomes.

Adaptation of these bodies (mind, emotion and physique) play significant role in stability of man's behavior while lack of the adaptation imposes the disruptions in the body. For example, lack of this adaptation produces confusions so that an individual may forget his name and be unable of perceiving lots of matters (such as his position) for a while. Actually, one who continually exposes to the inner disruption and instant sanity is not a perfectionist.

## **The Dipolar World**

There are numerous worlds in the universe that portray the Creators magnificence. One of these worlds is the dipolar world where is made up of two opposite poles. In dipolar world, man faces the dual tendencies and capabilities having opposite pole. For example, there are the dual attributes in the dipolar world such as good versus evil, guidance versus misguidance, justice versus injustice. These dual opposites become meaningful beside each other. In brief, the duality and bipolarity govern the universe. Two poles of positive (good) and negative (evil) create these dual attributes and form the conflict in the dipolar world. Now man lives in a world where is a section of the dipolar world. In fact, there are various levels and sections (the worlds) in the dipolar world. Thus, man experiences each of these worlds one after another. Adam begins to experience the dipolar world from an origin point and brings it an end in the same point because he must not be far from the origin. Indeed, God has a main purpose in designing the dipolar world. Otherwise, the world would continually retrograde and have no return to the origin thus the main purpose is not accomplished. Since the man has a round trip in the dipolar world, entire of this journey is executed in a cycle (figure.2-23). Thus, the dipolar world is a cycle which is made up of various worlds with the bipolarity attributes. Experiencing this cycle is initiated when the man falls down from the unipolar world.

The unity governs the unipolar world in which exists none of dipolar or multipolar worlds' attributes. Adam's journey initiates from the unipolar world (Eden) and ends to the same world. Yet, Adam's journey throughout this cycle (the dipolar world) is not scheduled. Thus, the start and end point of the journey in the unipolar world is free of time. Time is only applied/defined in the dipolar and multipolar worlds where are far from the unipolar world. For

example, time governs the world in which human beings are experiencing now. Yet, time is not applied to the past or upcoming experiences exerted in this dipolar world cycle.

Figure 2-23. The Unipolar and Dipolar Worlds

Man's journey through the worlds of this cycle demonstrates that he moves downward in the dipolar world's cycle. Thus, his return to the origin point (the unipolar world) is an upward motion/ journey.

The unipolar world is created free of time, space and conflict dimensions while the dipolar world cycle is created on the basis of conflict. The conflict is never omitted throughout the dipolar world cycle but is intensified in the downfall journey. The conflict intensifies in the upward motion of this cycle. Nevertheless, the conflict may tend toward zero but does not become zero because the dipolar world is based on the conflict.

There are lots of factors for increasing the conflicts such as dimensions of time, space. The conflict is gradually added in the downfall journey but it is omitted in the upward path. In fact, the multiplicity is seen more at the bottom of the dipolar world cycle thereby multiplicity is equal to a great degree of conflicts. The more man becomes far from the unipolar world, the more he faces to the conflicts. In other words, the unity is reduced and the multiplicity and variety of manifestations are intensified throughout this downfall journey. Moreover, by intensifying this multiplicity through the downfall path, the conflicts are increased. Yet, the multiplicity of dimensions and varieties as well as multiplicity arisen from the conflicts are reduced through the upward journey.

### **The Single Tree of the Dipolar World**

The unity governing the universal constituents is an undeniable truth. God is one thus His shadow is also One. In other words, the universe is a reflection of the image of God. Thereby, the integrity of the universe manifests that God is one. The multiplicity which exists in the universe is governed by the unity. Therefore, the entire universe is based on the unity.

In step of logic, human being's view of the universe is affected by the time and space dimensions. Thus, there is a disruption in the universal constituents so that the unity governing the universe is covered. Time dimension causes that man sees everything separate from its past and future. Each event is naturally seen at separate frames of time so that is observed in continuous pictures. Man is accustomed to see events and objects closer to his time-space dimension/man is accustomed to see events and objects closer to his location. Therefore, each event decomposes in different sections of

time-space dimension. This event separates from its past and future as it seems to be separated from constituents of the universe.

Nevertheless, when man goes beyond the dimension of time, he reaches a new worldview which creates a new picture of the universe. Thereby, the created picture is a real picture not an abstract one if time is omitted. Man is kept away from perception of time because he becomes habitude to respect to the laws governing time. when an observer looks at the dipolar world cycle from a position beyond time, he not only views past and future of each events but also observes how the events originate. He just experiences this position after reaching the step of love. Yet, he can nearly examine and confirm preciseness of this experience in the step of logic. For example, suppose that we can see a person in one frame of reference (in all ages) at the same time thus we see a being whose organs of the body are stretched. Thereby, we see a different frame of that person when we place in position beyond time.

When a person dominates the dimension of time, he can move back and view the origin of each object. He can observe the origin of all constituents of the universe that how they are created. In this scene, there is the diversity of life arose by a common descend/origin through a branching pattern of evolution. This common descend demonstrates that there has been a common bond among various species in the universe. Thereby, living things which have progressed from the simple to the more complex over time seem to have similar descend/origin. The more time is moved back, the more unity is observed in the previous branching pattern of diversity. For example, the consciousness governing the dipolar universe as a common point of the existence manifest continuity, coherency and dependency existing in beings of the universe. After overlapping all beings' existential layers, a tree is gradually formed that exhibits braches

attached to a trunk. This tree manifests that there is a connection, unity and relationship between its parts. The tree is known as "single tree of dipolar world".

Considering the integrity and unity existing in the universe, all constituents of the universe are parts of the united body. There is a connection among constituents of the universe that gives significant meaning to each constituent. When man understands this unity, he opposes nothing created in the universe. Thus, he recognizes necessity of the existence of each constituent of this marvelous complex. He comprehends that no creature and phenomenon are futilely created. Therefore, the tiniest particle of the universe has a prominent role in achieving the most eminent goal of the creation.

An unaware person is similar to a cherry attached to the tree. The cherry thinks it is unconnected to a cherry growing nearby it. This cherry is not informed of role of leaf, root and other parts of the tree in growing it; it just sees itself as a delicious fruit. The cherry cannot recognize that it is supported by other parts of the tree. Nevertheless, man reaches a specific worldview by understanding the unified body of the universe. Thus, he understands that each divine manifestation plays an important role in the universe so he opposes nothing and nobody. He finds out that everything throughout the universe composes a part of his body. Thereby, he reaches this truth which man's existence extensively embeds everything all over the world.

There is no doubt that the inclusive truth of existence of all humans refers to a single ego/self which is known as "Adam". Adam views the single tree existing in the dipolar world at the beginning of his creation in the unipolar world; because there is no time dimension in the unipolar world. Adam has a companion who associates with him

from the beginning of the creation. Moreover, his companion who is a set of necessities of his journey considers a part of this tree.

By moving to the single tree of life, Adam intends to undertake a journey towards the stages of achieving awareness and perfection. He needs a helpmate to accompany him through this journey. This companion provides him with facilities for moving/passing through each section of the dipolar world's cycle. So, when Adam chooses to go towards the tree, he initiates his journey from the origin point on top of the dipolar world's cycle. Of course, his helpmate accompanies him all over this journey.

Adam releases/disregards the plenty and super abundance existing in the Garden of Eden by approaching the tree (the base of his movement in the dipolar world). He chooses to go out of/ignore the paradise in which his awareness is unrealized (unawareness paradise) and to step into a paradise in which actualizes his awareness (awareness paradise). He signifies the tree which he viewed in the ultra-time position through his journey. Thereby, it is said that entire the universe is means of attaining his beloved.

It should be mentioned that this tree is also a single scenery of all scenes existing in the universe. Consequently, these scenes are gathered in a single image portraying its Creator.

### **Conflict and the peaceful people**

Conflict is one of the factors that cause lots of diseases. A peaceful individual overcomes his conflicts with anything existing in the universe. He makes peace with God, with each constituent of the universe, with one's self and with people. Therefore, his thought, speech and action are formed according to this inner and holistic peace. The peace is achieved through comprehensions of the

universe that result in making peace with God, with the universe, with one's self and with people. Making peace with God is the easiest stage while making peace with people is the hardest one. Indeed, making peace is categorized into the four stages from the easiest to the hardest:

Peace with God

Peace with the Universe

Peace with One's Self

Peace with people

### **Peace with God**

As long as man has no proper understanding of God's justice and wisdom/theosophy, any unpleasant events can make his conflict with God. This unawareness leads man to assume that God oppresses him. Thus, he not only denies divine justice but also expresses his displeasure of divine wisdom. According to divine justice (is the laws governing the universe), rights of all particles in the universe are respected. And divine wisdom lawfully executes the divine justice.

Man is created in accordance to a great and careful plan which follows a worthy goal. Divine wisdom (executing divine just laws) lawfully executes this marvelous plan. This truth is comprehended on the step of love. An individual who achieves illumination can either reach a deep peace with God or be thankful for becoming aware of divine justice and wisdom.

There is another factor of conflict with God that refers to lack of understanding of the philosophy of "worship". Lots of people misinterpret worship as an exchange with God/ many people

erroneously think that worship is a commodity through which a person trades with God while worship is an act for approaching God. Man is assigned to worship in order to increasing his certitude about the truths of the universe. Moreover, worship causes an inner alteration/evolution in man's existence to attain perfection. Establishing the Connection with God is significant in any worship ceremony; thus, a prayer subsequently enjoys this effective connection. He feels love inside him and be aware of his extraordinary role and position in the creation plan. Moreover, this feeling of love and rapture induces/ excites him to be constantly eager to pray. Thereby, he puts away this false belief that God needs his worship; or his worship is a bribe to God in exchange for gaining benefits or fulfilling his wishes.

In other words, there is no desire or obligation/boasting (upon God or servant) through a correct worship. A prayer has no expectation from God when he reaches the status of non-desire and non-favor. Consequently, man does not make conflict with God even though his wishes are not fulfilled by God.

Therefore, worship refers to an act of a servant who fulfils his mission that leads to transcendence. An individual who comprehends the reason of worshipping has no conflict with God even though his expectations are not fulfilled. Moreover, he prays God because of his love and eagerness created by worshipping.

The mentioned conflicts with God are solved via achieving comprehensions on the step of love. Thus, man reach the inner peace with the Great Lord. Furthermore, he makes the peace with God by understanding of "Ana-Al-Haqq"(I Am Right) which is the prettiest and highest rank of peace. God bestows of His Holy Spirit to man. So, he is manifestation of God's image that be respected.

Thereby, by understanding this blessing, man reaches the perception of "Ana-Al-Haqq".

## **Peace with the Universe**

The universe literally refers to a set of entities including the sacred nature of God (Abstract Truth or Non-Polar) and His creations (manifestations of the Abstract Truth). But the universe idiomatically refers to God's manifestations. The word "universe" is applied to a set of God's manifestations here.

The peace with the universe embeds two kinds of conversions/alterations:

1. Man understands the importance of each particles of the universe so that he is astounded by the deep relationship between the particles. He is indirectly attracted by the love flowing throughout the universe (which organizes this extraordinary system).
2. Man achieves this understanding that God's wisdom determines occurring any events in the universe. Thus, he should not impose his personal desire upon any particle of universe such as the heaven and time. Human beings are led to make peace with the universe via the adaptation with cosmic, adaptation with time and adaptation with the heaven.

### **\_ Cosmic Adaptation**

Cosmic adaptation refers to establishment of a harmony and compatibility with constituents of the universe. This adaptation leads to understanding of the unity governing the universe. In other words, the cosmic adaptation is applied to comprehension of being the connection and cohesion among the constituents of the universe;

thereby this integrity creates the united body/single-body. This understanding demonstrates that no constituent can be detached from the united body. In general, existence of each constituent of the universe becomes meaningful in connection to other constituents. This truth pertains to a transverse continuity existing between the constituents of the universe. Regarding the time dimension, time continuity also becomes significant. According to this continuity, each constituent gets meaning along its past and future though is indivisible of both. Interdependency of the constituents is another truth that indicates the dependence of each constituent on other constituents. Thus, each constituent plays in turn an important role in formation this dependency. The types of constituents or the nature of connections related to the constituents are often affected by the changes produced in the ecosystem. Yet, the universe always remains in balance. Each particle does not play the same role inside or outside of the complex related to it. Thus, the adaptation with the universe can result in making the balance in the constituents of the universe.

As earlier mentioned, there is an existential code for each particle of the universe that acts like a specific barcode of any trade product. This code varies depending on a system in which is located. For example, a liver cell performs a specific activity inside the liver that is different from the same activity outside of this organ. The liver cell has an existential code which changes after detaching from its organ. Thereafter, any cellular reduction occurred inside the related organ is different from the cellular reduction occurred outside of this organ (cell's individual life). According to the continuity law, existential code of each particle having a healthy consciousness is retained in continuity with other particles of a related system. Thereby, any reduction of a particle follows the entire reduction of related system.

Consequently, cell's detachment from a healthy system decreases the system's life span.

Human being is a part of this universe that should be accord/ adjustment and at peace with other particles of the universe. Otherwise, he suffers various mental, emotional and physical injuries and his lifespan is decreased. Man immune from all damages via expressing love that is considered as the most important immunity. Love to the universe keeps man away from suffering pathogenic agents. For example, there is a conscious relationship between pathogenic microorganisms and different individuals. Thereby, people who is at peace with outside world enjoy health and are less concerned with the contaminations.

The cosmic adaptation either produces coordination with the universe or causes the cognitive outcomes. One of these outcomes refers to understanding of the magnificent of the Beloved (God) in each particle of the universe. An individual who truly achieves this understanding respects to all divine manifestations (which are nothing but the beauties); eventually, he reaches to the state of gratefulness. The gratitude is versus to blasphemy. Blasphemy is the act of hiding the truth and a blasphemer is a person who ignores the sanctity of each particle in the universe (divine manifestations). The gratitude refers to appreciation of everything as God's blessings and a grateful person identifies God's graces. A grateful person confesses divine blessings and consciously and thankfully enjoys them.

### **\_ Adaptation with Time**

An individual who is not adapted to time suffers lots of diseases. Thus, he experiences the states of agitation and suppression which leads to the mental, psychological and physical disorders. In general, man would rather spend his time in accordance with his preference.

However, time which is a major/conscious constituent of our universe, resists against man's dictatorial wishes. For example, when a person wants time to pass slowly, in his viewpoint time goes by fast and vice versa.

For example, a prisoner would rather spend his jail time faster while time behaves against his preference. The more he wants time to pass quickly, the more time goes by slowly for him. Yet, people living outside prison prefers time to pass slowly because they have no enough time to get everything done.

The clock hands constantly move everywhere and for everyone; so quantity of time is the same for anybody. Nonetheless, those who want to make time goes faster or slower feel unpleasant. They experience/bear this suffering because of their dictatorial wishes. Thereby, time is affected by an individual's inner desire which leads to make time pass faster or slower. In other words, time quantity is constant but individual's emotion is varied in different conditions.

By achieving adaptation with time, man is coordinate and match with time. He submits himself to time regardless to his dictatorial wishes so he enjoys divine blessings. Otherwise, each constituent of the universe is prevented from connecting to the whole and from receiving awareness and inspiration. A person who makes peace with time deserves receiving awareness and inspiration. Moreover, his enthusiasm for understanding the truth of the universe results in receiving the inspirations. The inspiration is similar to a mail package which is directly delivered to a recipient. Thus, the recipient can only access to this package when he is present at the place; otherwise, he cannot reach this message. In other words, when a person wants time goes by fast, he moves ahead of present time/draws away from

the present time or vice versa. Consequently, he receives no inspiration and illumination if he does not live in the moment.

Most of people would rather reach their destinations without spending time. Thereby, man prefers to omit time thus he is time killer. In other words, man do not often agree with time and just thinks of destination. When time is not respected, it consciously and lawfully resists against man and leads him to disappointment.

Time reacts against man's inner excitements and inflammations. It seems that false excitements make man to feel time moves so faster. In other words, the more fake excitements and tensions arisen from technological developments of the modern life increase, the more man feels time speeds up. For example, people who lived fifty years ago felt well about time; they felt time went by slower. Thereby, people will feel time goes by faster after passing fifty years.

Moreover, pace of life in a village is slower than in a city. People living in a city live under the pressure brought from agitations. So, they feel time goes by faster compared to villagers. People living in cities are affected by unimaginable rapidity of cities so that they prefer to stop passing time. Being in hustle indicates that the city people tend to take more time. Thus, they try to have a dictatorial behavior against time while time resists against their wishes. But in villages where life moves at a slow pace, there is no rapidity. Thus, no one tries to have a dictatorial behavior against time. On the other hand, villagers do not prefer time going by faster so they feel time passing longer.

### **Adaptation with the Heaven**

Man complains about the heaven's oppression from old days and expresses his displeasure of it. These complaints demonstrate that

the heaven is not affected by man's wishes. Nevertheless, humans still expect their endless wishes and desires are fulfilled. Desires of insatiability and greediness do not release man for a while so that he constantly expects the universe to fulfil his correct or incorrect wishes. This vain attempt for accomplishing earthly wishes lead man to suffer the mental, psychological and physical diseases. Otherwise, if his wishes are not fulfilled, he experiences depression and despair and other disorders.

Earthly desires are accomplished when an individual submits to the heaven's laws otherwise his wishes are inaccessible. Therefore, the heaven seems consciously and lawfully behave.

When man overflows with divine enthusiasm, he moves in perfection path and removes all his concerns about earthly wishes; these earthly wishes are dictatorial factors against the heaven. On the other hand, when man becomes adaptable and compatible with the heaven and the universe, he can establish a friendly and favorable connection to the heaven. Thereafter, he can easily disregard the earthly wishes and he achieves inner deep revolutions. The adaptability and compatibility with the universe are the base of these inner revolutions.

Consequently, man makes peace with the universe when he coordinates with the universe and constituents therein as well as he understands each constituent's value. Yet, making peace with the universe is not as easy as making peace with God. Thereby, man reaches peace with the universe by establishing connection with God and enjoying His mercy and compassion.

## **Peace with One's Self/Ego**

Man makes peace with himself/herself when he/she identifies his/her position in the universe and achieves self-cognition. He can desirably and efficiently manage his personal/inner faculties on basis of this awareness. Moreover, he makes peace with oneself when he identifies all kinds of conflicts existing in the universe.

The primary basis of man's conflict with oneself as well as other conflicts refers to the bipolarity of human nature; this state can provide man for reaching the growth and maturity. Each person contains conflicting pairs of opposites; in essence, man holds all sorts of opposites within. Thus, he tends to move towards perfection or anti-perfection. If man cannot restrain his tendencies towards anti-perfection, the inner factors related to anti-perfection tendencies remain active. Thereby, man cannot experience peace with one's self.

Lack of balance among man's multiple tendencies is a major factor in appearing conflict. This factor is programmed in the foundation software that is present at birth. Everyone may reveal a dominant tendency and specific reaction thereof. These innate tendencies consist of seclusion-seeking, preference-seeking and affection-seeking which sequentially produce reactional behaviors of escaping, aggression and compatibility. An individual having normal personality establishes a balance among these three tendencies and the reactions related to them. Attaining cognition, awareness and cosmic adaptation create improving insight/worldview, eventually a balance is established in one's existence.

Individual's insights and criteria play main role in creating conflict or peace with one's self. Moreover, programs stored in the foundation software are affected by individual's criteria. The experiments

demonstrate that unawareness, wrong criteria and insights produce any conflict with one's self as well as so many disorders. There are some examples of such conflicts:

\_ When an individual cannot bear social, political, economic and cultural conflicts, he loses his inner balance afterwards suffers conflict with himself.

\_ An individual who cannot discern between good and evil feels distress. Thus, he becomes confused at making decision so that cannot get a desirable outcome and suffer conflict with himself.

\_ Lack of coordination and compatibility between one's thought and action lead to excessive inner tensions that eventually cause psychosomatic diseases. These tensions are the signs of making conflict with one's self.

\_ People who fall in narcissism state apparently seem to be at peace with themselves while they intensely injured. So, they suffer the intensive inner conflicts.

\_ Those who find a large gap between their real character and ideal character fall in conflict so that may reveal an emotional mechanism such as insanity. Most of people hospitalized in insane asylum/ mental care centers interest in playing the role of famous scientific, military and religious characters. These individuals' agitation and distress produce defensive psychological responses that lead to the disturbance of insanity. They would like to display themselves through ideal and beloved characters; and they want to believe that they are real. In this disorder, the defensive self (refers to defensive psychological response) becomes coordinate with the cell and body's management center (a part of the mental body) thereafter the

connection between the executing self and the ideal self is cut off. Thus, an insane presumes that the ideal self is his real character.

There are other similar examples making conflict with one's self. Nevertheless, all kinds of conflict factors prevent man to make peace with one's self. Man needs to achieve an awareness and understanding in order to controlling and managing these conflict factors. Thereby, man reaches the deep self-cognition.

### **\_ Peace with others**

Conflict with others is the main barrier on achieving the status of a peaceful man. As earlier mentioned, there are four types of making peace that is considered as four stages of perfection path. Thereby, passing through the stage of making peace with others is the most difficult stage. So, making peace with others is the significant stage in the path of perfection journey.

There is a difference between humankind and other beings that refers to man's trait having no fixed and predetermined behavior. He behaves on basis of his freewill so that instantly creates a new effect (including new thought, behavior and speech) in the universe. In other words, humankind is a creator thus his fellowman is affected by his existential impressions and the radiations thereof. Thereby, dissensions, conflict of interests, annoyances and misinterpretations provide man for making conflict with others.

Therefore, man realizes the sacredness of each constituent of the universe by comprehending the universe (as the Unified Body) so makes peace with the universe. Nonetheless, he cannot easily make peace with others. Thereby, man ignores that everyone is a divine manifestation hence people dishonor others' sacredness. Nevertheless, when an individual achieves a comprehension to

accept everybody's status in the universe, he will put away his hatred and conflict against the person who has improper behavior.

Therefore, he expresses his opposition/opposes to one's false attitudes and insights in a right approach while ignores these wrong behaviors. He pays his full respect to all humans as the divine manifestations thus makes peace with them.

### **Theory of Existential Software and Hardware of Human Beings**

In Interuniversalism, there are software-based and hardware-based parts installed in human existence. Thus, man's physical body is his existential hardware that is managed by a great system of various soft-wares. Thereby, there must be a software behind his hardware. Consequently, human beings are programmed by the software-based part.

### **Theory of the Field of Consciousness**

As mentioned the earlier, each particle in the universe is affected by different fields such as gravity, electromagnetism and so on. Each particle has a certain behavior in each of these fields. Psymontology introduces another field which is called "Consciousness Field". At the present, this field can only be understood through experience.

### **Types of Behaviors in the Consciousness Field**

#### **1. The Behavior of Particles in the Consciousness Field (Hardware-Based Behavior)**

The behavior of each particle in such field is governed by the laws of consciousness. The behavior of a particle in the consciousness field is different from the other fields. Moreover, each particle's character is different in new fields so that does not follow the previous laws.

There are many behaviors of particles that appear in consciousness field such as formability, decomposability and combinability (repair). An example about formability case refers to Emoto's experiment showing that water molecule structure changes in the consciousness field. Furthermore, there are various experimental treatments of decomposability via Faradarmani method. For example, some diseases such as kidney stone and coronary thrombosis are treated in the vicinity of a new consciousness field. In Faradarmani, repairing the spinal cord is performed via combinability behavior of each particle.

## **2. Software-Based Behavior in the Consciousness Field**

**\_ Software-based Correction:** in a consciousness field, software programs of human beings, animals and plants can be corrected in a new consciousness field. These programs eventually create a behavior.

**\_ Software-based adjustment:** in a consciousness field, software programs of human beings are capable of adjustment and harmony with a new consciousness field; and consciousness immunity is an outcome of software-based adjustment in a consciousness field.

### **Theory of Consciousness Immunity**

In a consciousness field, behavior of a microorganism depends on harmony of the common consciousness between a microorganism and its carrier. This behavior is not necessarily adjusted with the true character of a microorganism. Consequently, some people may carry microorganisms but do not become sick.

The consciousness immunity is divided into two categories:

## **1. Natural Consciousness Immunity**

This category applies to people who keep animals in their living environments. These people are exposed to these animals' microorganisms without becoming sick. Microorganisms are foe to nobody and act differently in the vicinity of new consciousness field. Consequently, these people normally gain consciousness immunity.

## **2. Artificial Consciousness Immunity**

This category of consciousness immunity is one of the main goals in Psymatology. Thereby, many disorders are improved in the vicinity of a new consciousness field via Psymatology approach. This process is performed in connection to Interuniversal Consciousness Network. For example, correcting sleep pattern and breaking addiction and etc. are performed in the vicinity of a new consciousness field.

## **Theory of Consciousness Contamination**

According to one of the theories defined in Psymatology, man's emotional states can produce non-physical radiations (consciousness radiations). These kinds of radiations are neither wave nor particles. These positive or negative radiations can have positive or negative effects on others. Thus, an individual is affected by others' different emotional states. Thereafter, he feels a pleasant or unpleasant state and displays different moods. Nevertheless, the individual makes different reaction. In other words, when the negative radiations are issued from an emotional body, others are affected and contaminated by these radiations. For example, those who live near depressed people, feel depressed after a while. In addition, those groups of people who are exposed to radiation contaminations are

psychoanalysts, psychologists, doctors, dentists, hypnotizers, lawyers and etc.

## **Disturbance in the Consciousness Field**

### **1. Software-Based Consciousness Disturbances**

- \_ Entry of wrong programs into software-based parts of human beings
- \_ Getting Contaminated by non-organic viruses
- \_ Wrong translation via physical receptors such as:
  - sensors' disturbances arisen from usage of addiction drugs
  - wrong data produced from mental and ultra-mind sensors
  - physical injuries

### **2. Hardware-Based Consciousness Disturbances**

- \_ Cellular consciousness attacks (inflammatory and destructive diseases):
  - the cell is attacked by the immune system (auto-immune diseases)
  - attacking the nerve's myelin sheath
  - attacking the joints
  - attacking the mucus of the mouth, etc.
  - attacking the transplanted organs' cells
- \_ Disturbing the cell's function, such as:
  - disturbing the normal functions of cells
  - disturbing the cellular multiplication (cancerous cells)

- \_ Consciousness replication of a healthy cell to another one
- \_ Consciousness transmittance from a defective cell to other cells

### **1. Software-Based Consciousness Disturbance**

There are several ways which could result in software-based consciousness disturbances.

#### **\_ Entry of wrong programs into software-based parts of human beings**

Programming man's existential soft-wares can be disturbed via receiving any wrong data from the environment. Nonetheless, outcomes of these wrong data appear during performance stage. For example, when parents improperly behave toward their children, the children adopt a wrong impression about their sex roles. For example, when parents continuously repeat to their daughter that she resembles her daddy, the daughter is programmed that begins to change. She gets impression that she is a man because she looks like her father. So, she behaves like a male because of this wrong pattern while in a reality she is a female. Consequently, she may be led to homosexuality disposition.

#### **Subjects Disturbances (Bad Environmental Educations)**

These disturbances refer to reported matters and types of subjects. These cases are attributed to wrong environmental programs which lead individuals to an erroneous programming. The wrong patterns are known as bad-education. For example, if in a city the traffic laws are not respected, people would begin to define all their inner programs on the basis of this wrong behavior. Moreover, orderly people would also not want to respect the traffic laws. Therefore, they choose to go with the flow and not become disgraced. Hence,

they choose to violate the laws to keep themselves safe from being judged.

### **\_ Getting Contaminated by Non-Organic Viruses**

Non-organic viruses make disturbance and interference in consciousness fields and software-based programs. Moreover, these viruses can directly influence software programs.

### **\_ Physical Wrong Translation**

Since physical senses report raw data to man's mind and psyche, any wrong data may cause wrong software-based programming. The following are some cases of wrong physical translations:

**-sensors' disturbances arisen from usage of addictive drugs:** these drugs make disturbances in body receptors. Thus, these sensors insert wrong raw data to the mind and psyche. In other words, an addicted individual's report is different from healthy and ordinary one.

**-Wrong data arisen from mental and ultra-mind sensors**

**-physical injuries**

Man's physique, psyche and mind are linked and interrelated. Physical damages have serious impacts on man's emotional and mental outputs. Thus, these damages make disturbances in the functions of the physique, psyche and the mind so these three do not reach any proper outcomes. For example, suppose that a television has a problem in showing a good quality picture. Obviously, there may be many reasons for this disruption. One reason is that the television set needs maintenance. Other reason is that the receiving antenna has no strong signal from the transmitter center. Or the receiving antenna may need a readjustment while the local signal is

still traveling from the transmitter to the receiving antenna. Nevertheless, the television has no image in all of these states. Similarly, an individual may suffer disorders in the result of the physical damages (hardware) specially the brain damages (the collection of antennas). Thus, the correlation among his physique, psyche, mind and other bodies are disrupted. Consequently, man encounters problems and attains unpleasant outcomes.

## **2. Hardware-based Consciousness disturbances (Consciousness Disorders)**

Consciousness disorders appear in several forms:

### **\_ Cellular Consciousness Attacks (inflammatory and destructive diseases)**

In these kinds of diseases, antibodies are secreted to attack the same cells. The antibodies initially inflame the cells and then begin to destroy them. In Faradarmani's viewpoint, the main function of the immune system is recognition of cell by its consciousness. For example, some species of insects can recognize each other via their odors. So, odor recognition is critical in the infrastructure of insect colonies/in the infrastructure of this species of insect. Similarly, when the consciousness of an organ's identical cells is disrupted, the cells' consciousness and radiation become incongruent. Thus, these cells are attacked by the immune system. The consciousness disorders are often caused by different factors:

**-the cells are attacked by the immune system (auto-immune diseases):** the immune system may attack different parts of the body that causes special diseases, such as:

- attacking the nerve's myelin sheath (Multiple sclerosis)
- attacking the joints (Rheumatoid arthritis)

-attacking the mucus of the mouth (Pemphigus vulgaris)

### **\_ Attacking the Transplanted Organ's Cells**

In spite of determining the successful molecular similitude between donor and recipient and despite the accurate performance of medical tests, a transplanted organ may still get rejected by the immune system. Even if the transplanted organ belongs to a close family member, transplanted organ can still be attacked by the immune system. Indeed, an individual's consciousness field is disturbed through the organ's transplantation without any physical disorders. According to Faradarmani, non-adaptability and mismatching of the transplanted cellular consciousness with the recipient cellular consciousness cause the transplant rejection. Thereby, the recipient management center cannot recognize the new organ; the transplanted tissues are attacked by the defense system. It should be mentioned that the body's management center (mind) distributes the cellular consciousness throughout the body. In some instances, the graft is taken from one part of an individual and transplanted elsewhere in the same individual. For example, in an open-heart operation, the immune system may reject the graft because its cellular consciousness does not match the heart's cellular consciousness. Therefore, the individual's consciousness field may receive severe disturbances. The factors such as distress disrupt the body management. Distress can make disturbance of the consciousness and cause mismatch of the cellular consciousness. In other words, when the patient's mind faces complications, his organized consciousness is not unified and neither is it matched with the whole consciousness. Moreover, after blood transplantation, individual's physique, psyche and mind may contain the undesirable complications because of the consciousness mismatch.

**\_ Disturbing the Cell's Function:** in this case, the cell's consciousness is disrupted so that the cell forgets its duty. Thus, the cell is prevented from its proper functioning. This type of disturbance includes:

**-disturbing the normal function of the cell:** in this state, the cell is not attacked, inflamed and destroyed, but its function is altered. For example, in some types of thyroid diseases, although the bodies' iodine level is appropriate, yet the thyroid gland does not allow in any iodine.

**-disturbing the function of the cell's multiplication:** this kind of disorder refers to the alterations in the process of cell's multiplication. Thus, the cell falsely executes its duty. The abnormal multiplication can occur in two forms:

**-abnormal cell division/growth in the multiplying cells:** an uncontrolled cell proliferation and erratic cellular growth such as all types of cancers.

**-abnormal lessening in the multiplying cells:** reducing cell's multiplication and leading to the cell's exhaustion.

**\_ Replication of Consciousness of a Healthy Cell to Another One:**

A cell's data is transmitted to another one even if there is no original cell in the vicinity of the new cell. The data transmission is achieved via the consciousness transmission. For example, the normal womb tissue (Endometrium) can be copied into the other part of the body. Since each body cell has all the data saved inside every cell, the origin cell can be copied into the new cells. Thereby, when a new cell is exposed to the origin cell or somehow it receives the origin cell's data, the origin cell can get replicated. Moreover, there is another method for renewal of a cell. In this method, a new cell is replicated

by being exposed to a stem cell. This method is the same one which is applied in the modern medical technology for replacing the new organ via the stem cells. In Faradarmani, lots of treatments are achieved by this principle (the theory of the capability of transmitting the data to a cell).

### **\_ Consciousness Transmittance from a Defective Cell to Other Cells:**

A cell's wrong signal can spread to other cells via the consciousness transmission. Thus, the agreeable cells are matched to the defective cell and begin to develop irregularly. The defective cell induces the healthy cell to have an erratic proliferation. According to the medical term, the process by which defective cell breaks away from its organ and spreads in the body is called "metastasis". Nevertheless, the separated/traveled cell may remain inactive in other parts of the body because there are no lymphatic and blood vessels in that area. Therefore, Faradarmani approach examines the other possibility which is introduced as the theory of the capability of consciousness transmittance. According to this theory, the defective cell acts similar to a tuning fork (when one tuning fork vibrates, the other one sitting closely also begins to vibrate) so it transfers its consciousness radiations to other cells. Each cell which is adaptive and compatible with the origin cell receives the defective cell's data. Consequently, the defective cell is multiplied and copied in the mentioned section. Indeed, the defective cell's consciousness and data are carried to other cells. In Faradarmani process, the defective consciousness is affected by an Interuniversal consciousness field so that the defective cell's metastasis, transmission and vibration are stopped. In this process, the defective cell is matched and adapted with the

healthy cell and then the cell's erratic proliferation is controlled. Thereby, the injured cell is repaired and recovered.

### **Theory of the Consciousness Charger**

Data can be transferred from a flash memory to a computer, likewise the consciousness can also be transferred to a patient's body via food, clothes and etc. In Faradarmani approach, the theory of consciousness charger refers to the direct treatment of a patient's consciousness disorders. Thereby, the patient's consciousness disorders can be directly treated by charging his/her foods and etc. instead of establishing a connection to the Interuniversal Consciousness Network. The consciousness charger has two methods:

#### **1. The Natural Consciousness Charger:**

Everything in the universe is naturally becoming charged. Each object's consciousness is also exposed to the other one in its environment. For example, when a group of people settles in a place, the place is exposed to the people radiations. Thus the place becomes charged in the people consciousness field. People who wear the second-hand clothes are also exposed to the consciousness radiations left onto these clothes. In other words, those who owned these used clothes left their consciousness radiations over these clothes. Thus, an individual who is wearing the second-hand cloth may feel distressed or relieved. Similarly, when an individual receives blood from a donor, he is affected by the donor's consciousness charger. Therefore, when an individual receives a depressed person's blood, he may also get depression after the blood transfusion. Or in the organ transplant, the recipient individual gets the donor's consciousness charger. The new organ will have its natural

consciousness charger in the new site (which is the recipient's body).

**2. Unnatural/Artificial Consciousness Charger:** in this kind of consciousness charging, individual transfers his/her consciousness radiation to objects such as, foods and clothes and to the places. Thereafter, the objects and places get charged.

### **Theory of Collective Soul (Collective Reflection)**

The collective soul is a common entity (non-physical body) shared by all human beings. The collective soul is similar to a spherical mirror which encompasses all humans. Each individual is symbolically located at the center of this mirror. Thereby, the resultant of individuals' thoughts and their different radiations are reflected back on each individual through this mirror; and then this radiation is intensified. Thus, the resultant of the individual's thoughts manifests itself as a common property of that society and is conveyed to the upcoming generations. Each of the collective souls of a family unit, a village, a city, the planet Earth and animals can act independently and eventually have a comprehensive reflection on the entire universe. As mentioned earlier, there is a consciousness hidden behind every motion; consciousness is neither matter nor energy. Nevertheless, awareness (consciousness) rapidly spreads through the universe; the awareness travels in less than a second throughout the universe. Since the awareness is not controlled by the dimension of time, it can spread all over the universe. The universe looks like a crystal from a long distance. Experiments demonstrate that water molecule have different reactions against defective or healthy consciousness. The universe is affected by the collection of man's consciousness; humankind is the collection of human beings. Therefore, the consciousness of all humans can develop the universal

crystal into a normal or abnormal form. Humans can contaminate the universe; the reflection of this contamination is sent back to our planet.

### **Theory of Non-Organic Viruses**

One of the main theories of Psymtology is the theory of Non-Organic Viruses. According to this theory, humankind encounters viruses which can influence his/her mind, psyche and physique. These viruses pass through man's existential data files and produce interference and disorder by contaminating the files. When these parasites penetrate the mind's data files, they can bring several kinds of diseases and many complications including hallucinations, abnormal behaviors and cravings. In Psymtology, these disorders can be cured by the removal of the symptoms of these contaminations and also by liberating the patient from the non-organic viruses. After several decades, this theory is confirmed through various experimental cases.

The term "Non-Organic Beings" is applied to beings which are without biological corporeality (devoid of an organized structure). These beings' unidentified structure is not amassed with any atoms or molecules. The non-organic beings having no physical structure are not comprehensible in the scientific world. Moreover, these beings' frequency zones are different from the human beings' frequency zone. Thus, the science is not capable of identifying and tracing the non-organic beings. The only possible way of identifying these beings and removing their related disorders is found through empirical evidence. The non-organic beings may initially seem incredible and strange things in the world of science. Similarly, Pasteur's and Koch's discovery of germs (microbes) were mysterious

and unheard of for the people of last century; but their experiments were accepted after a while.

The non-organic viruses are classified into two types: type A and type B. There are common properties between these two type that capture the man's mind; these common properties cause disturbances, diseases and influence man's decision making behavior.

There are numerous beings in the universal ecology and each is created for a particular purpose. Some of these non-organic beings exist in the chain of nature and they play a role in man's existence. The other ones are designed and created to enhance the quality of man's life. So, each type undertakes its distinct duty in the path of perfection.

Type A's role was defined before the creation of human beings. These beings set up man's path towards perfection. The non-organic beings are invisible and incorporeal who can reveal themselves to everybody in appropriate conditions (when an individual provides such conditions). Moreover, these beings are capable of changing their facial features. The non-organic beings undertake different duties. For example, one of these beings' duties is to protect the universe. Thereby, an individual who desecrates any particle of the universe (including breaking a tree branch, disrespecting a person, accusing and backbiting) is attacked by these beings.

Type B is man's mental body that remains after his death and is experienced afterlife. Some of these mental bodies may have strong bonds with this world so they cannot accept their death for a long time and they envisage a body for themselves. These mental bodies tend to return to their attachments and live as if they are still alive. For example, a mental body tries to communicate with its family and

provide information about the present state. These reports are based on the mental body's imagination formed by its attachments that can occur in the individual's dream or wakefulness. Man's attachments not only leave him with negative effects in this world but also prevent him from development and perfection after death.

There are several disorders caused by non-organic viruses:

- \_ Mental Disorders: hallucination, dual and multiple personality disorders, bipolar disorders, obsessive compulsive behaviors, phobia, hyperactivity disorders, unusual/abnormal inclinations such as inclination to suicide, unusual behaviors such as sleep walking.

- \_ Psychological Disorders: depression, agitation

- \_ Physical Disorders: incurable diseases, hard-curing disorders, genetic disorders

- \_ Physical-Mental-Psychological Disorders: disturbances in sleep quality

- \_ Disorders with Unknown Origin: unknown bruise signs, swelling, wounds, scratches

The non-organic viruses have other various signs and effects in addition to disturbing the man's mind, psyche and physique. There are several ways that the non-organic viruses leave negative impacts on man.

- \_ The direct impact on the different parts of man's body

- \_ The indirect impact on man's body:

- impact on various reactors and channels of vital energies and the disturbances leading to indirect disturbances in different parts of the body

- impact on man's software-based parts influencing his physique
- corruption of man's perceptions and emotions via penetrating to mental staff and occupying software programs leading to hallucination

Various factors contribute to infect man with non-organic viruses:

- being in the negative state (anger, fear, sorrow and etc.)
- addiction
- misusing the non-organic viruses in order to attain their evil goals
- lack of coordination between the bodies in result of usage of psychoactive drugs, alcoholic drinks and etc.
- heredity
- desecration of any particle of the world
- ignoring the universal unity and practicing polytheism
- emission of negative radiation such as backbiting, lying and etc.
- causing corruption and preventing the prosperity of each particle of the universe

Today lots of people encounter complications and diseases arisen from interference of the non-organic beings. These beings interfere with man's external affairs (the social affairs) and internal affairs (the mind's management of cells and body's activities, world view and decision making). By growing the depth and intensity of the complications and by the lack of knowledge about the non-organic beings, one's personal and social health is increasingly endangered. Therefore, lots of people are exposed to enormous hazards and are prevented from exerting their humane missions.

## Theory of the Function of the brain

Brain consists of receptors which transmit the data of different senses to man's different bodies including mental body (perceptual part), psychological body (emotional part) and other bodies. Thereafter these messages are translated into physical language (figure 2-24).

Figure 2-24

## Theory of Relationship between Brain and the Bodies

Science considers man's brain as a supercomputer which acts as the commander of the body and directs the body into a vital and intellectual path. The brain's vital and staff activities include:

### 1. Physical Activities

\_ Internal Activities: control of body's vital activities such as respiration, heartbeat, blood sugar, blood pressure, adjustment of body temperature, adjustment of insight, movement of eyelid, ...; and recognition and reaction such as examining pain

\_ External Activities: voluntary movements such as moving hands, feet, head, neck, ...; and involuntary reactions

## **2. Mental Activities (Step of Logic)**

- \_ Collecting the Data
- \_ Learning and Storing in the Memory
- \_ Recalling and Extraction from Memory
- \_ Setting-Up the Data (Thinking)
- \_ Distinction of the Data
- \_ Comparison of the Data (Logic)
- \_ Insight Evaluation (Interpretation/perception of External Events and the Universe)
- \_ Selecting and Making Decision (Freewill)
- \_ Imagination
- \_ Designing
- \_ Making Freewill

## **3. Passionate Activities (Step of Love)**

- \_ Enthusiasm
- \_ Joyfulness
- \_ Amazement
- \_ Sacrifice and Devotion
- \_ Love
- \_ Excitement

## \_ Rapture

Nevertheless, if the brain is accepted as a supercomputer, some questions are brought up. For example, a computer needs an operator for programming. Thus, no system can either program itself or apply that program without the existence of an operator. So, these questions are proposed: if the brain is regarded as a super-computer, where is its operator? Is the operator a part of the brain or is it independent from it? Moreover, this issue is viewed from different angles. The brain is composed of neurons which are the distributor of the brain's electrical system. Neurons act like an electric contactor. In fact, a collection of neurons forms an electrical command circuit by which all the body's automated systems are controlled.

In a command circuit, electric current may be switched on and off via opening and closing the contactors. Pulses received from different receptors turn the switches (contactors) on and off; thereafter all physical and mechanical activities are automatically executed.

Similarly, electrical current passes through a neuron by the neurotransmitter thus the neuron is an electrical distributor.

Considering the above brief explanation about neurons, this main question is proposed: 'where is the neuron's operator? Does a neuron consist of a separate brain? Hence, where is its operator located? Other questions can be raised about the neuron. For example, is it the neuron that decides a man should go towards unity or multiplicity? Does the neuron determine man's lifestyle? Does the neuron decide that man should fall in love, does the neuron decide that man should become amazed or surprised, or persuaded and to devote and sacrifice?

The neuron, obviously, is not capable of doing this. In fact, some neurons control the body's automated system. The non-automatic functions get their messages from a center other than the brain. Indeed, the brain is a detector so it receives the orders from the psychological and mental bodies and translates the messages into the language of physique. The mental and psychological bodies are not parts of the brain but these two parts are located in a transmittance state to the brain.

The brain consists of cortical and subcortical units. The subcortical unit controls the body's automated system (heartbeat, respiration). The mind operates all cells of the body. The cortical unit is a collection of antenna that translates the different messages received from the mind and psyche. If this collection of antenna is damaged, the received messages are not translated. In this state, the subcortical part is activated and then it executes the vital activities; however, the mind's contact with the environment is cut off. Thus, the individual lives like a plant so that he is deprived of a recognition which leads to perception and feelings. This state (lack of relationship between the mind and the brain) is called "brain death". In the brain death, a patient may return to life when the link between the antenna (the brain) and the mind is established again (after a correction process).

In Faradarmani and Psymetology process, the brain function is divided to the following:

- \_ Controlling the body's automated activities
- \_ Controlling the body's non-automated activities
- \_ Brain Memory
- \_ Manifestation of the intellectual and emotional activities

- \_ Receiving the external data via the different physical sensors
- \_ Transmitting the physical sensory data to the different existential bodies and receiving sent data of the bodies
- \_ Translating the received data from the different bodies into the language of physique by producing the chemical secretions.

### **Theory of the Secondary Nervous System**

Transmittance of the nervous signals is implemented by two pathways: the first one is transmittance of the messages from the central nervous system and the brain, and the other one is done via the secondary nervous system. In other words, each nervous message is transmitted either from the brain or from the secondary nervous section. Thus, the existence of two types of nervous systems speeds up the response from body organs. For example, a package is sent to a place by mail while receiver is simultaneously informed by phone that a parcel is on the way. Therefore, the receiver becomes aware of the package before its arrival; he/she knows what it contains.

## **Chapter 3**

# **The Bodies of Human existence**

## Dimensions of the Human Existence

In psymentology, the dimensions of the human existence are defined on the basis of Interuniversalism. Interuniversalism has an omni-lateral/complete view of human being. In this viewpoint, the dimensions of human existence are limitless and comprise numerous different software and hardware. All the hardware components are eventually managed by a software part.

Some components of human existence include:

1. The different bodies such as: the physical body, psychological body, mental body, astral body...
2. The various energy transformers known as "Chakra"
3. The different energy channels like the fourteen non-physiological channels which are limited or blocked in the body. Acupuncture examines it.
4. The numerous energy fields surrounding the body such as: polarity field, bio-plasma field ...
5. The components like: cellular consciousness, molecular frequency, several software parts and the other countless unknown elements

In the Interuniversal approach, each component is studied in the relation to the other elements. Physique, psyche, mind, other bodies and all components of human being are correlated together. So if any component is impaired, the other components will be destroyed. Therefore, it is impossible to be diagnosed with an illness or an Intelligence system to exactly scan the body and diagnose and cure the defective part. Such an Intelligence Network known as

Interuniversal Consciousness Network is applied via psychometry. In fact, this Network includes the Intelligence and Consciousness governing the whole universe. It functions just like a "cosmic Internet" which has placed all the components of the world under its intelligent coverage.

Human beings are made up of thousands bodies which form the non-material part (beyond the frequency field of man's physical receptor) of the body. As earlier mentioned about the brain's function, lots of man's perceptual fields are not managed by a cell. For example, a physician advises a patient that he can overcome his disease with keeping his good morale. What does the physician intend to say? How should a neuron have a good morale or how can the neuron create a good morale?

In the other hand, a psychologist may talk about the collective soul or collective unconscious; this question may be asked where is the center of collective soul or collective unconscious located in a neuron or the brain?

Nevertheless, as earlier mentioned, the neuron is not capable of doing this. The neuron cannot decide man should fall in love. The neuron cannot determine man's lifestyle. It cannot decide one become hopeful or hopeless. The neuron cannot decide that man should become amazed or surprised, or persuaded and to devote and sacrifice. It is not the neuron which makes jokes. There is no logical circuit or command circuit which is capable of making a joke or fun.

Man's different activities are managed via other bodies of human existence except his physical body. The energy feeding system of these bodies acts in a separate way. Nonetheless, the structure of

these bodies is beyond man's sense and physical perceptual receptors.

### **The Mental Body**

The mind manages all man's existential dimensions as well as software parts of man's existence such as cell's function, memory management, learning and recalling. Man's understandings are the outcomes of the mind's function. In Psymatology perspective, the mind does not consider a part of the brain while the brain function is affected and managed by the mind.

The understandings refer to an individual's interpretation of the universe including inside or outside of man's existence. The mind analyzes messages received via the five senses in the brain. Everyone has his unique interpretation of each message and gets the different results from his physical sensors.

An individual may perceive a pleasant feeling after seeing an event while the other has no such feeling. Moreover, someone may reach a superior understanding by seeing the same event compared to a person who is unable to understand it. He may see an event which nobody is capable of observing it.

In Psymatology, this kind of interpretation is named " perception" which is revealed through the mental process. Furthermore, the mind undertakes to manage the memory, to set up data and manage the cell and the body.

The mind is divided into two subdivisions:

**1. Instinctive Mind:** refers to the mind by which the necessary data related to the instinctive needs is set up and processed then the appropriate solutions including struggle for survival are offered and

implemented. For example, an ant knows how to build an anthill and how to carry food to its hill by aid of the instinctive mind.

**2. Perceptive Mind:** the mind in which data is set up and processed so that man is capable of interpreting and describing the creator, the universe and his surroundings. Thereby, man can propose different attitudes and understandings of different phenomena. This kind of perception belongs to human beings. The perceptive mind is only activated in man's existence not animals or plants.

The mental body consists of several subdivisions which fulfil management and organization. Yet, each of these subdivisions are in turn considered a separate body (figure 3-1). These are:

- \_ management and organization of the Eternal Data archive
- \_ memory management
- \_ Data set-up management (making thoughts)
- \_ management and organization of the cell and the body
- \_ perceptual organization

Figure 3-1

**Management and Organization of the Eternal Data Archive:** man's memory functions different from the brain that will be alive after his death. The people who tries to summon the dead soul intends to gain information. Thereby, the dead's memory is alive while the body and the brain are decomposed. In fact, the memory and the data archive do not spoil thus the individual's data is internally kept.

**Memory Management:** the memory management removes selected data from its original file. For example, an individual who has already composed a poem can remove it from its original file located in his memory. Thus, the memory management looks for the composed poem saved in a related file. He may also intend to recite a verse of the Quran thus the memory management goes to the original file to find the considered verse. The vocabulary should be selected word by word. For example, when we call the telebanking system, we hear this message " your...account...is...". In fact, telebanking system removes each word from its original position inserted in the system memory and set sequentially up.

**Data Set-up Management (Making Thought):** this management center has to put the cutting data together then a new thought is made up.

**Management and Organization of the Cell and the Body:** this is a part of the mental body in which the cells' duties are determined. This part has a specific anatomy consisting of hundred billions of invisible branches connected to the cells of the body. Thus, the cells are managed by this part of the mental body. For example, a blindfolded man is suggested there is hot coin on his palm while it is put a piece of ice on his palm. It is observed that the man's palm blisters in reaction to heat.

The reason is that the body manager is misled by this wrong data and based on it transmits message to the local cells. The cells accordingly react against being burnt. Had the man's eyes been open, this reaction would never happen because the body manager could not be deceived in such manner. Therefore, the physical reaction depends on the command of the body manager not the physical touch.

There are some factors which cause the body manager issues a wrong command and duty for a cell or cells. For example, a cell may suffer an overproduction (cancer) or cellular failure (entropy) because these factors reduce so much amount of the body's manager energy. These factors are:

\_ Being affected by unnecessary subjects which have no relation to the person and no impact on his life.

\_ Getting into conflict with the unity of the universe and separating the universe into fragments, as well as creating discrimination and multiplicity. These factors waste lots of the mental energy.

Since man's mental energy is limited, he requires a plan and design named "Mental Energy Management" to use efficiently this energy. So, we should examine the mental energy management to save our mental energy.

For example, consider a pedestrian who is passing by a pavement and sees hundreds people. He characterizes them on the basis of their appearances (such as fatness or thinness, beauty or ugliness...) and even psychological traits (such as being malice or not, inner personality...) and judges them accordingly. Nevertheless, none of these assessments are useful for anybody.

These judgements about the unnecessary subjects burn the mental energy and make disorder in the mental management center. Thereby, management of the body and cell is disturbed.

As it is showed in the figure 2-17 in chapter two, the mental body fulfils distributing the consciousness throughout the body and cell. In other words, the vital consciousness distributes in the body and its organs, tissues, cells and DNA via the mind consciousness. Moreover, this consciousness is managed by the mental management center of the consciousness distributor.

### **\_ Subconscious Mind**

The subconscious mind is a software which is often programmed in the first 5 or 6 years of man's life. The subconscious mind defines and stores all of man's good and evil patterns, his fundamental thoughts and his previous life experiences. So, change of the subconscious patterns seems to be difficult.

The subconscious patterns may be changed by connecting to Interuniversal Consciousness Network. The subconscious mind plays a role in formation of man's insight as well as determination of how to receive revelations.

Nevertheless, if the subconscious mind is programmed on the basis of the logic, man suffers a kind of the mental block. Thus, man deprives of attaining the ultra-mental revelations and inspirations which the logic is unable of understanding it.

The subconscious mind consists of the various software programs:

#### **1. The Programmed-self (the Primary Character):**

\_ Nature

\_ Foundation

\_ Institution

\_ Gene

## 2. The Programmable-self:

\_ The Acquired Personality (the Secondary Personality)

\_ The Automation Motion Parts

\_ The Extra Programming Parts:

\_ Conditional Programming

\_ Reactional Programming

\_ Crucial Programming

\_ Filtering Programming (the Beliefs)

## 3. Defensive-self (Second Mother, Psychological Defense Reaction)

## 4. Chief Justice-self (Special Court)

### **\_ Programmed-Self (The Primary Character)**

Everyone brings some software parts with him by birth that are not the same in different people. Each person is born with a unique software parts which is named "the programmed-self". The programmed-self consists of nature, foundation, institution and gene. The primary character (the programmed-self) is not inherited. The primary character is the outcome of the previous world.

- **Nature:** it refers to a software which exists in humans with the same program. There are the general principles such as perfectionism, quality-seeking, questing, self-awareness, motivation, recognition, comparison and assessment/evaluation. These inner tendencies produce motivation in man and make him be active.

- **Foundation:** The foundation software comprises of two parts. The instinct software responds to the vital/natural needs. The functional software follows the principles embedded in human beings. Thereby, human's functions are under the influence of these principles.

- **Institution:** this software is programmed in human beings on the basis of the qualitative growth in the previous life (having an additional dimension except time, space and conflict). The institution determines his fundamental temperaments after transferring to the present world. So, the institution originates various primary characters in different people which creates diversity. Thereby, even the identical twins display different behaviors against their environment. The children of a family have different personality traits, too.

- **Gene:** it determines the dominant traits and archives all physiological good and evil records. Therefore, wrong lifestyle of the previous generations manifests as diseases or disorders in following generations. Indeed, each generation's disease transfers to the next one and vice versa. A generation's longevity and healthy life are related to a correct lifestyle that surely transfers to the next generation. Thus, gene archives the positive and negative records. Gene encompasses both software-based and hardware-based data. Gene's hardware data is related to physical body that determines the traits such as facial features, height, hair and eyes color (morphology). Gene software-based data embeds physiological good and evil records (functional parts) of previous generations and individual's behavioral tendencies.

## **\_ The Programmable-self**

There are some parts accompanied by programmed-self software that are programmed through human's life. These new parts are

programmed via the programmable-self software. Indeed, both softwares of programmed-self and programmable-self make human's characteristics. The programmable-self software defines/describes everybody according to what data he acquires in his life and how to apply the programs existing in the nature, foundation, institution and gene soft-wares. There are some parts of the programmable-self:

- **Acquired Personality (Secondary Personality):** this is one of subconscious parts that is formed, programmed through the childhood. The secondary personality makes pattern from the environment and finds a definite direction.

- **Automation Motions part:** patterns of human's successive motions are saved in the memory of automated motions / movements part in a little while. Afterwards, these motions are carried on without thinking. For instance, when a typist starts to learn typing, he has a lot of difficulties to find the place of each letters on the keyboard and spends lots of time for it. After a while, subconscious memory will acquire to the places of these letters and save the positions of hands and fingers. Then the typist automatically does this action so that he can type without looking to the keyboard.

#### - **The Extra Programming**

- A/ Conditional Programming:** human is programmed for many conditions according to pattern "if...., then..." Thus, he is frequently programmed for every behavioral patterns and even against many diseases. For example, people are programmed during childhood that if they come out of bath and sit in the wind, then they will surely get a cold or suffer sinusitis. These kinds of diseases are called "The Conditional Software-based Illnesses".

**B/ Reacting Programming:** there are a set of reacting programming so that an individual daily performs them. For instance, parents have frequently told their child to eat more because he/she is so weak, but there is no border for it how much he should eat. So the child is programmed according to this word. After a while, when he grows up and gains weight, he still likes to eat more. Or when a child defecates on a rug, he is blamed by his parents. Now this child who has grown up suffers the chronic constipation. Consequently, this program has recorded in child's subconscious so that the evacuation of bowel does not regularly occur.

**C/ Crucial Programming:** there is another program in the extra programming of programmable-self that is named the crucial programming. According to the crucial programming, individual demonstrates the behaviors and tendencies contrary to the primary traits. For example, if a girl continuously hears that she is similar to her father, she will display the male behaviors and tendencies in adulthood. Improving this kind of programming is very difficult.

**D/ filtering Programming (The beliefs):** this software includes/forms our beliefs. For example, parents frequently tell their children to be wise and repeat this word so that these children just realize a pattern on the basis of formula " $2 \times 2 = 4$ ". Thus, they are programmed according to this cold logic and when they become adult, they cannot realize subjects out of the logic. So, they are unable to perceive metaphysical subjects. As a result, the filtering program locks the mind and not to let enter other information outside its framework.

#### **\_ Defensive-Self (Second Mother, Psychological Defense Reaction)**

Defensive-self or second mother is the most important part of subconscious that provides compatibility with the environment. This

software considerably decreases instant tensions and distress. Since the defensive-self software does not follow a logical behavior and is a kind of escape of reality, this software is accompanied with a self-deception. The defensive-self acts like a mother who lovingly defends her child. So, although applying this software becomes a necessity, it may be very hurtful for human beings.

### **\_ Chief Justice-Self (Special Court)**

Defensive-self or special court is located in the subconscious and acts on the base of self-assessment system and punishes individual who offend his duties. The accused person is condemned and as a result suffers a disease by this court for issuing the negative potential energy. This kind of disease is called psychosomatic disease that is known as disease related to special court.

### **\_ The Logic Filter**

The logic filter keeps humans away the entrance of the illogical and irrational data into his mind. Therefore, this software controls the mind function as the body manager. The unreal information is implemented on man that may be dangerous in some conditions. The logic filter consists of two subdivisions:

**\_ The Conscious Part:** which is located at the level of consciousness. The individual is aware of the conscious framework and tries to consciously use it. Everyone has a unique definition of rationality and reason in his being software. The software is programmed with the true and false information which is known as "logic". Thus, the individual refers to his logic to make decisions and choices.

**\_ The Subconscious Part:** which blocks involuntarily the entrance of information into man's mind and not to let the false information enter his mind. The entered information initially examines via this

part. Thereafter, the data is coordinated with the individual's logical beliefs and rational standards which he experienced throughout his life. Then the checked data is permitted to pass and enter into the other the subconscious areas.

For example, if a person gets angry against the difficulties of his life, he says that he cannot live anymore. Man's conscious part of the logic filter exactly understands that he just wants to have a change in his life conditions. So, he does not mean that he becomes blind. Yet, if this word enters into his unconscious part of the logic filter, the expression of "not to see" is not interpreted into the physical body. But if this part is convinced even a little that the person does not physically want to see, this message enters into the will power part and is executed. Then the message is performed via the body and cell management. The management center commands to his eyes' cells not to see. Therefore, the person will suffer from the hysteric blindness while his eyes are in the healthy state.

### **\_ The Subconscious Filter (the Subconscious Mind)**

There is another filter in the subconscious part which is named "the subconscious filter". This filter includes all logical and illogical information of the individual's experiences gained throughout his life. Furthermore, this part includes some information in which the individual has got in result of a certain thought, or the data which his family, environment and society program in him. There is a filter at the entry point of data on this part. If the entered data is not adjusted to the contents of this filter, the data will be rejected and not to be passed through this filter. When the data is accepted, the entered information reaches into the will power part and it is crucially executed.

Everyone is created with a special program in his subconscious software that makes something possible to be performed or not. When the filter notices that the entered data is not readable, the filter rejects the data. For example, when an individual is just programmed on the basis of logic and wisdom, the logic filter will severely reject the subjects out of this field.

### **\_ The Will Power and Executive Part**

The subconscious filter confirms the data and then the data will send to the "will power and executive part" and is executed. For example, if a person decides to walk on the fire, the subconscious filter strongly resists against this data. Thus, the data does not pass into the will power and executive part. So, the individual does not want to step on the fire at all otherwise he will extremely burn. But the individual can change the program of this filter via the suggestion and self-hypnosis after several years so that he will be able to step on the fire. Thus, he not only has no feeling of hot but also he feels cold and freezing. The cells of this area are not destroyed because they have no orders from the mental body for reaction of burning. Similarly, there are the organisms which lives in the depth of 2500 meters and bears the temperature of 250 centigrade while their cellular structure is similar to man. Yet, these organisms' duties are defined according to such environmental condition. Therefore, they act under such circumstances and not to be also destroyed.

### **\_ Hypnosis**

Hypnotism is a process that the data (suggestion) passes from the logic filter into the subconscious. The data transports from the filter of subconscious to the will power and executive part and makes a state known as hypnotism. According to the medical definitions, hypnotism is done when the information reaches the subconscious

part. But in Faradarmani and Psymatology perspective, the entered data has to also pass the subconscious programming software. So, making a suggestion and rejecting the suggestion are defined in following:

### **\_ The Common Definition of Hypnosis**

**Data (Suggestion) → The Logical Filter → The Subconscious → Hypnosis State**

### **\_ The Definition of Hypnosis in Faradarmani**

**Data (Suggestion) → The logical Filter → The Subconscious Programs Filter → The Will Power and Executive Part → Hypnosis State**

### **Making Suggestion**

As earlier mentioned, there is a software program in the subconscious part that is programmed on the basis of entered data. The data programs this software during the lifetime specially in the childhood. All the input data and programs are initially adapted by this filter then they are permitted to enter after checking. When this software does not resist against the input data and programs, the individual can make the suggestion. For example, an individual is programmed to be logical and rational person through his childhood. This person will resist against the subjects beyond the logical and reasoning field such as the metaphysical matters so that he cannot accept these subjects. Therefore, this data can neither pass through his subconscious nor enter the will power part.

For example, an individual is suggested that his eyelids are becoming heavy and heavier through a hypnosis process. The individual's

subconscious starts to analyze this message but do not find any reason for getting heavier the eyelids. So, this part does not confirm the received message. Consequently, the hypnotist's effort for suggestion is useless. The people who resist against the hypnotist's suggestion are called "non-suggestible". In contrary, the people whose subconscious software assume everything is possible and permit the input data to pass through are called "suggestible". Nobody may be hypnotized without ability of making suggestion and hypnotists' efforts for suggestion will be useless. In fact, a person who is hypnotized determines the result of the hypnosis process not the hypnotist.

### **Psychological body**

The psyche is another part by which man's emotions are revealed. The mind's conceptual reaction to an event is then followed by the reaction of the psyche. Thereby, the mental perceptions are translated into the emotional language according to the predetermined programs and the known criteria. Now, man's emotions are characterized such as sorrow, joy, fear, hatred, fortune, misfortune, pride, hope, despair, disgrace.

The psyche is divided into two parts:

**1. Instinctive Psyche:** refers to the emotional stimulus center in which each instinctive needs are responded. For example, when one is hungry or thirsty, he may become angry, bored, agitated, psychological instability and then depression. Or if an animal cannot mate in the breeding season, it becomes depression. The instinctive psyche is a common factor causing the psychological diseases such as depression among mankind, animals and plants.

## **2. The Affective Psyche**

The affective psyche is only set/put in mankind's existence that reveals man's emotions. Man's emotions carry a purpose which is represented via this part of the psychological body. Man is capable of showing an appropriate emotional reaction to his interpretation and understanding of outward events via this part. Thereby, all man's emotions embed an emotional effect including positive or negative effect. Thus, the feeling of happiness and sorrow, hope and hopeless, fortune and misfortune, pride and disgrace emerge and give a different meaning to the life and the existence.

As mentioned above, the psychological body is another important body of man's existence that finds out, examines and reveals the emotions. This body considers the outcomes related to the step of love then transmits the messages related to this step to the brain. Thereafter, the brain reveals the appropriate reactions from the physique. For example, when a person sees a scary scene, this scene passes in his perceptual filter in which the intensity of produced dread is assessed. Thus, different people may unfold different reactions to this scary scene. Similarly, consider a woman who passes out when she sees a mouse running across the room floor. Yet, another woman may not have the same reaction in such condition.

Therefore, when the external events/stimulus are assessed, the brain reacts by transmitting the chemical messages into the physical body. Thus, the person initially gets scared then his brain pumps Adrenaline throughout his body in order to getting the body ready for the fear response. The body is firstly affected by the outward stimulus then a signal is triggered in the brain. The brain releases a chemical signal related to the stimulus so the symptoms of fear appear.

The psychological body is composed of two positive and negative sections:

**\_ The Positive Section:** man's positive emotions are discovered and perceived in this section in which the positive radiations are absorbed and emitted. Therefore, the brain produces a chemical message related to the positive emotion and the positive section courses the positive radiation through the body at the same time. Moreover, this section absorbs the positive radiations if there are the positive feelings surrounding the individual. When an individual is using the positive section of his psyche, he is in a state which is named the "positive phase" whereby he can only emit or absorb the positive radiations.

**\_ The Negative Section:** man's negative emotions are discovered and perceived in this section in which appear the emotional responses such as anger, revenge, hatred, stinginess and jealousy. Thus, the brain applies the relevant response to the negative emotion which produces the toxin within the body. Moreover, the negative section starts to make the negative radiations. So, the individual with the negative emotions exposes others to his negative radiations. This negative individual is in a state known as "negative phase".

Man can only apply one of the sections of his psyche at the same time: the positive or negative section. When the individual is in a negative phase, he automatically locks the door of positive section of his psyche. Thus, he emits the negative radiations into the universe. On the contrary, he locks his negative section's door of his psyche by being in the positive phase. It seems that there is a door at the entry point of the positive and negative sections of the psyche. When the individual chooses the negative phase, the positive section's door is

locked. Thereby, he will be deprived of the emission or absorption of the outcomes resulted from the positive section.

Man's thoughts, behaviors and actions determine the radiations thereof. For example, when we look so warm at someone, he receives our positive radiations whereas our angry feelings carry the negative radiations. The more one receives the positive radiations, the more he avoids the disorders and injuries. Thus, he enjoys the high life span coefficient.

The positive or negative radiations are produced independent of the space dimension. The intensity of these radiations are not affected by being far or near the individual with positive or negative feelings. When an individual is in the positive phase, he is affected by no negative radiation because the negative section's door of his psyche is blocked. Otherwise, he is bombarded with the negative radiations. On contrary, when the positive radiations move to him whom is in the negative phase, he cannot absorb the positive radiations. Thus, the individual is deprived of the positive outcomes resulted from this section. He should continue to be in the positive phase to avoid receiving the negative radiations (figure 3-3).

There is an area in man's psychological body in which his life span is determined known as the "life span coefficient". Thereby, the more one absorbs or emits the positive radiations, the more he enjoys the life span coefficient.

There are other soft-wares by which the received positive and negative radiations are evaluated/determined. There is a type of energy which is absorbed or rejected due to man's emotional states. For example, when an individual is praised, admired and adored by others, he absorbs this type of energy (energy type 2). This person becomes too happy to forget his tiredness even he may lose his

feeling of hunger. On contrary, if he is blamed, denounced and disgraced by others, he is discharged, bored and feels weak. This type of energy may be the basis of the "psychological war". For example, this psychological technique may be used to demoralize opponent soldiers. The soldiers are misled by the false news so that they lose their energy to continue fighting. Moreover, the soldiers' national and militaristic prides are hurt and their powers are lowered.

There is another software in which the degree of one's satisfaction or dissatisfaction is assessed; accordingly, he receives or loses his energy. For example, after buying a used car, if the buyer is told that he has paid the car over the odds, he may feel discharged energy; he may even suffer a fever and get sick. On contrary, if he is told that he has paid good price for the car, he may be too happy to stay awake all the night without feeling tired. Moreover, there is self-assessment software which plays main role in feeling popularity and respectfulness.

The another software evaluates man's feelings of guilt or innocent. Thereby, he gains negative or positive scores and can accordingly lose or absorb the energy. When the individual loses the energy, his immune system acts weak thus he will be more susceptible to diseases.

There is a software by which man's needs and wishes are estimated. Thereafter, when his wishes are not fulfilled, he gains a negative score and loses his energy. On contrary, when he is satisfied, he absorbs energy thereafter he feels good.

"Being idealistic" is measured by a software which leads man to gain or lose energy. For example, in a football match, the fans of the winner team receive a lot of energy so that they are capable of

running for kilometers. On contrary, the supporters of the loser team lose energy and cannot even talk. They feel extremely tiredness and become depress.

There is a main software in which gained or lost radiations are examined afterwards the "life span coefficient" or the "coefficient of cellular fatigue" are determined. Thereby, the more positive energies are absorbed, the more these coefficients are increased thereafter man enjoys a usual longevity. But the more negative energy is absorbed, the more the life span decreases. So, being in the positive phase has a great impact on man's health. Thus, if an individual with a positive enthusiasm is exposed to the good (positive radiations) while an individual with a negative enthusiasm is exposed to the evil (negative radiations).

In other words, as shown in figure 3-3, the grey part starts from the negative section at the minimum level and increases as it moves towards the positive section. The illustrated section is called the life span coefficient.

It shows that the more the positive section is used, the more man's longevity increases. On contrary, the more the negative section is used, the more his life span decreased. Therefore, being in the positive phase is the important factor in increasing man's life span.

Figure 3-3

## The Astral Body

The astral body is the another important body of man's existence. There are two main functions fulfilled by the astral body:

1. Directing the Automatic Growth
2. Transmittance of the Nervous Messages

**1. Directing the Automatic Growth:** this part is related to the manner of cells' set-up that followed from the embryonic development to the final developed stage. Thereafter, the recovery and repair stages are continued.

### **2. Transmittance of the Nervous Messages**

Transmittance of the nervous signals is fulfilled by the secondary nervous system. The transmittance is implemented by two pathways: the first one is transmittance of the messages from the central nervous system and the brain, and the other one is done via the secondary nervous system. In other words, each nervous message is transmitted either from the brain or from the secondary nervous section. Thus, the existence of two types of nervous systems speeds up the response from body organs. For example, a package is sent to a place by mail while receiver is simultaneously informed by phone that a parcel is on the way. Therefore, the receiver becomes aware of the package before its arrival; he/she knows what it contains.

Consistency of the movements is the another duty fulfilled by the astral body. Thereby, since speed of the feedback commands issued to the organs is fast, the organs' movements are seen consistence.

The body's quick reaction is another utilization of the astral body by which the secondary nervous system can be activated via practice.

For example, people who practice the martial arts utilize the astral body without having any knowledge about this body. When an individual sees an event, he needs about 0.3 seconds to make a decision and then takes action. But in martial arts, some movements are performed in a much shorter time. In Japanese fencing, the attack and parrying are practicing through a very short time and without any thinking. The skills of martial arts are taught on the basis of sensing with no thinking. Indeed, the trainee learns that thinking is not important while his body parts automatically react against the attacks. Moreover, he learns that he has no enough time to think because in a fencing competition just some hundredth of a second is important for his survival or death. So, there is no chance for thinking and deciding in such a short time.

Does each organ of the body have a brain thereof to react against attacks? The answer is that according to Faradarmani and Psymontology, the secondary nervous system can instantly request the organ's reaction without aid of the primary nervous system. It may be said that the automatic motions part of the programmable-self is responsible for performance of the automatic actions (typing, driving). Yet, it should be reminded that the automatic system only accomplishes and controls the actions with a certain, limited and well-defined range. Thereby, the skills such as fencing have no limited range so that one may be attacked from all sides. But in the actions such as typing, all motions are predefined and predicted for the automatic motions part of the programmable-self.

In martial arts, the sensory range and the environmental sense are enhanced against any movement via the extremely practices. Thus, the trainee can even react against the tiniest environmental movements with the closed eyes.

There is another reason for necessity of the astral body when a person's organ is cut off. He feels pain and tickling in a limb which is not physically part of the body anymore. In medical terms, this phenomenon is called "phantom pain" by which a patient experiences the illusion relating to the amputation organ. He assumes that this limb or organ is still a part of his body thus shows such reactions.

The secondary nervous system fulfils the body movements' feedbacks otherwise all man's actions and speeches would be performed in a broken forms similar to robots.

Figure 3-4 The Astral Body

## **\_ Death Types**

In Faradarmani and Psymatology perspective, there are three types of death:

### **1. Silent Death**

### **2. Physical Death**

### **3. Definite Death**

**Silent Death** happens when the aura of depression negative energy encloses man's body. Thus, the entire man's perceptual connections are cut off. Although he understands the meaning of everything, nothing can produce any excitement in him. He becomes like a walking corpse and becomes susceptible to the silent death (figure3-5).

**Physical Death** is defined as cessation of the heartbeat. In medical science, death refers to the moment at which life ends. Thus, the dead one is permitted to be buried. But in Faradarmani and Psymatology viewpoint, the definite death has not still occurred

because the hundred billion cells as well as mental, psychological, astral bodies are yet alive at this point.

**Definite Death** happens when the astral body dies. Death of the astral body often starts some minutes after the cessation of the heartbeat. The astral body can even stay alive for some days after the heart stop. As long as the astral body is alive, death is not yet definite and one may come back to life. Thereby, there are many people who come back to life after the physical death even though the dead bodies are kept in the mortuary.

In medical viewpoint, this concept would be considered impossible. Yet, as long as the astral body is alive, any shock which stimulates this body can cause the vital force to flow through the body. The heart which is stopped for a while starts to work again and blood flows through the vessels without any coagulation.

Nowadays, there is no scientific evidence in regard to the people coming back to life after the burial certificate. Since there are the various reports of such cases, the government attempts to review the laws related to the burial certificate. The government intends to pass a law such as keeping the corpse in the burial waiting room in order to acting more control over the conditions.

After the definite death, the mental body just stays alive and transfers to the next life. The mental body is the same part which is called "ghost or spirit". The actions such as summoning the spirit, the mental body of the dead person is summoned. Thus, the people establish a connection with the mental body which is attributed to the non-organic virus type B.

Therefore, man's information and experiences are accurately recorded in the mental body. Hypnotists can penetrate to the very deep layers of the mental body where the information is accessible.

### **The Principle of the Mind, Psyche and Physique Interrelation**

According to this principle, the outcomes of the mental, psychological and physical activities are transmitted in a cycle (figure 3-6). For example, when someone hits his body against something, feeling the pain disturbs his mental and perceptual activities. Thereafter, his psychological and emotional functions are hurt. On the other hand, his mental set-up specifies a feeling related to negative reaction against the hit then determines the intensity or weakness of the pain and the pain tolerance.

Figure 3-6

Suppose that a person is fleeing because his life is at the risk, he suddenly gets a badly injures in his way. Thereby, his mind does not permit the pain to appear and his psyche follows the mind so that avoids any emotional reaction associated to the pain. Thus, the physique feels the less pain. The more one is in danger, the more the mind can handle/control the pain. Yet, there is any justification which is effective in controlling the pain such as the pain caused by

the plastic surgery. Furthermore, there are some people who tolerate the pain in practicing the religious duties. For example, those who intend to perform the Hajj (an Islamic pilgrimage to Mecca) have to tolerate the pressure and pain during this religious journey. Others may bear the pain for reaching their beloved. Consequently, the pain reported via the physique is affected by the mental programs.

A mouse tries several ways to catch a piece of cheese which is not accessible. The mouse sets up the data in its mind in different ways and tries to reach the cheese more and more. Nevertheless, if the mouse cannot catch the piece of cheese, it will suffer disorder. Similarly, if man cannot provide his sustenance, he may also suffer the disturbances in his body.

Man's physique, psyche and mind are linked and interrelated. Physical damages have serious impacts on man's emotional and mental outputs and vice versa; as in the hydraulics, the pressure exerted on a point transmits to the other points. For example, the drug is consumed via a physical organ but it can make disturbances in the mind and psyche. The mind can also disturb other parts of the body. For example, when a person hears the unpleasant news, he gets the physical paralysis. So, according to the cycle of the mind, psyche and physique interrelation, two other bodies are affected by the pressure exerted on each of these three bodies (the bodies of mind, psyche and physique). Thus, the ultimate result of this process leads to production of a chemical substance. In general, this process cannot be merely a chemical phenomenon because the functions of these three bodies may not be separated. Thereby, if the physique is damaged, the functions of the psyche and the mind are also disturbed. So, the perceptual language has the chemical effects thereof and the emotional signals are translated into the chemical

languages thereof. According to the principle of the mind, psyche and physique interrelation, the emotional language can be generated by injection of a chemical substance in the body. For example, a person can feel happy or sorrow or other emotions after injection of a special chemical substance. Thus, all these processes are fulfilled via the chemical or hormonal languages throughout the body. Nevertheless, we can conclude that these chemical substances create all emotional states in man's body while the other parts of the body can be effective in producing these states, too.

In general, if we are discussing about the man's health, we should examine all the factors related to his health.

### **The Self**

Suppose that the complex of man's existential bodies (the mental, psychological, astral and physical bodies) acts similar to a machine. The Self is the driver of this machine. The driver moves in the dipolar world cycle. The free will is the main traits of this driver which discriminates him from other beings in the universe. He is always judged in this dipolar world that his freewill gives the meaning to his life through this cycle. So, he experiences, learns and passes the divine tests by aid of his freewill throughout this dipolar path. The freewill and the path of movement provide the one's self for demonstrating the driver's ability in his journey towards attaining perfection.

The self needs a special vehicle in each section of this dipolar world cycle. The consciousness governing the dipolar universe plays the significant role in formation of the self. The consciousness determines the laws which manage section of the path up to some stages. The consciousness forms a special vehicle for each section to the self can transport to the next section of the path.

Furthermore, there are other attachments which come with the self throughout the path. Each of these attachments acts as a type of vehicle which is separated from its origin one by one in this upward travelling/journey. Therefore, the self misses one of the different attachments in every sequential lives. The self can experience each of this life in the different sections of this upward path. The self may be similitude to an onion which misses one of its layer in each new stage.

As earlier mentioned, there is a temporary vehicle due to the existing section that is only used in the same section. Thus, the temporary vehicle remains in the same section while "the self" transfers to the next life. For example, the set of man's physical, psychological, astral and a part of the mental bodies are carried by the self only in this world (the world having dimensions of space-time and conflict). These attached bodies remain in this world after man's death but the self goes on travelling to the next life. The self is equipped with a new vehicle due to the new world's extent. Moreover, the self brings the attachments including the nature, foundation, institution, the communal soul, the data set-up management to the new life. Yet, the software adjunct to the main software remains in the previous life while the main software is transferred to the new life.

## **Chapter 4**

# **Ecosystem and its Character**

## Ecosystem

Ecosystem is a complex of all components of the material world that controls and manages the connection and interaction among the constituents. Nothing in the ecosystem can exist without connection to other things. Any change in the material world is carried on by the ecosystem. Therefore, birth, death and any changes in the components of the material world are determined and executed by the ecosystem. For example, the Big Bang phenomenon, creation of the solar system, formation of the planets such as the planet Earth and beginning of the life all has been executed by the ecosystem.

In the ecosystem, each component feeds on the other component and survives. The universe is perpetuated by the interrelations between various components of the great ecosystem. The combination of these relationships provides sustenance and provision in the world. God has established these relationships according to rules. This set of rules is regarded as 'sustenance provider' in the universe (Flow). The another rule is that particle's spins occur as a consequence of the centrifugal and centripetal forces.

Ecosystem follows the determined purpose. Ecosystem is aware of its origin, destination and aim of its creation. Ecosystem produces various exchanges, changes and plans in the universe to actualize its aim. Thus, the ecosystem has character, identity and behavior; since its motion has direction, this direction gives it identity. Ecosystem behaves in adaptation with its direction and identity (figure 4-1). Consequently, the ecosystem has character and considers as a living being. Therefore, life needs to manifestation. Manifestation requires motion. Motion comes after behavior. Behavior needs direction. Direction brings identity and the identity, eventually, creates

character. On the other hand, motion results in the exchange of the energy. The exchange of energy leads to exhaustion/fatigue and entropy. Finally, we will have changes, birth and death.

Moreover, the ecosystem embeds the components' character of its subdivisions/subset.

Figure 4-1

Ecosystem as a living being has a memory which is called **cosmic memory**. Such a being must also have a mind as it presents the system with a thought that leads to identity. This is called the **universal mind** which must involve a consciousness that guides the cosmos toward a determined goal. Since the cosmos is considered as a living being, it should be embedded the vital force. The vital force is flowing throughout the cosmos and is displayed via the different detectors. There are various forms of these different detectors on the planet Earth that have created various species of human, animals, plants and microorganisms.

### **Ecosystem's Character and Behavior**

In psymentology, the software behind every manifestation / appearance, presence and behavior is called character. In other words, character is the software that exposes each particle of the universe's components on the scene of ecosystem.

The manner of appearance, and the manifestation and the type of

the actual participation of each member of ecosystem is called behavior/the manner in which it appears, manifests, participates in the ecosystem is called behavior of each constituent. Consequently, the character contains all factors and behavioral programs. Character displays all properties of a member of the ecosystem.

### **The relationship between character and behavior**

Character is a software program behind every behavior and it has many potentials. Behavior depicts a character that is actualized (figure 4-2). We will generally talk about the true character here. The true character is behind the scene and it hasn't been displayed. Anyways, we own a real character that appears on the scene. There must be the software behind each character that is displayed a behavior. In other words, there have to be a plan that is formed a behavior. Therefore, the software behind all these stories contains the orders and duty description.

Figure 4-2. Relationship between Character and Behavior

### **Preliminary Principles Governing the Ecosystem and its Components**

\_ Each component of the material universe's components has behavior, identity and character.

\_ No character can be defined for a particle that is not connected to other particles.

\_ The character of each part may be composed of some characters of its subdivisions.

\_ A character can be composed of the smaller characters; in other words, character of a component can be resulted from some its subset characters. By combining two or more permanent characters, a new permanent character is created. The new character is generally lawful. For instance, sodium and chlorine each has a permanent and separate character. But when sodium and chlorine are compounded, salt is made. Salt has a new and unique character. The character of salt is neither similar to sodium nor similar to chlorine.

\_ Each character is considered a living being with different levels of life.

\_ Ecosystem is a character that has also behavior and identity. Since no character is defined without the connection to other characters, there must be another ecosystem or ecosystems.

\_ It requires that a thought/concept have existed behind every behavior, identity and character, so there must be a concept in back of the ecosystem.

\_ Each character can be considered as an organization.

\_ An organization is an independent character that may have numerous characters of its subset.

Therefore, the character is defined for a component while this component is connected to other components. This part is controlled and monitored by another part. There are two general characters in relation to the environment:

\_ Isolated Character

## \_ Public Character

For instance, the character and the behavior of a microorganism is completely different in an isolated cultivation lab from the behavior of a microorganism living in a living being's body.

### **Ecosystem's character**

Ecosystem embeds the numerous characters of its subdivisions/subsets. Thus the ecosystem should have a definite/determined character. If there is no observer, no character will be defined for any part. Consequently, each ecosystem is interrelated to other ecosystems (no particle is defined without interrelation to other particles). /and as the character of a part cannot be defined without an observer, the ecosystem must be in connection with other ecosystems. It needs the other element that creates all ecosystems. Therefore, this element controls the ecosystems. But all these ecosystems require "causal factor" that can control them as well. This element is known as the Consciousness governing the material universe or the "Interuniversal Consciousness Network". /This causal factor is the "Interuniversal Consciousness Network"\_ the awareness or Consciousness governing the material universe which obeys and implement God's will (figure 4-3).

Figure 4-3. The Casual Factor of Ecosystem

## Status of the Ecosystem

Ecosystem is a factory that produces characters as well as implementing and creating diversity (figure 4-4). There is the Creator or designer on one side. Then the Consciousness designs the universe's scheme via the Divine decree/ according to God's command. Afterwards, the Consciousness has supplied the ingredients. These ingredients (primary materials) consist of cosmic intelligence, cosmic life and cosmic force.

\_ **Cosmic Life:** life for car of the creation is like an engine of a car.

\_ **Cosmic Force:** it is like car's fuel.

\_ **Cosmic Intelligence:** it is like driver. A car can't solely be moved by engine and fuel. There must be a conscious driver who drives the car and makes it move.

For example, an ant is a living being. The cosmic force provides an ant with capabilities. An ant doesn't recognize how to build an anthill, what its duty is, who a slave or a queen is, and how to rank. An ant cannot choose its behaviors and duties; the ant's behavior is managed via the Interuniversal Consciousness or the cosmic intelligence. Therefore, if all components of the universe were equipped with the intelligence, they would have certainly been aware of manners and aims of existence as well as their duties in the universe.

As a result, these three elements, the cosmic life, cosmic force and cosmic intelligence provide initial materials for the ecosystem. Now, the ecosystem is an administrator/executing agent. This administrator applies laws and provides initial materials in order to implement designs and plans in the production line. The first production leads to creation of the material world or the Big Bang.

Figure 4-4. Status of Ecosystem

The first production results in other productions and laws:

**1. The Law of Entropy:** the entropy causes change. Change brings birth and death. All the universe's components and parts change. For instance, the sun eventually comes to an end when its hydrogen sources end. As a result, the sun crumbles then the sun explodes. Afterwards the Supernova occurs. Then the dying star transforms into a black hole. Thus, we have new birth time after time. Moreover, the last Big Bang was the other expansion and after a while a contraction occurred. Ultimately, change causes diversity. The entropy law offers diversity to the ecosystem. In other words, the law of entropy is the automatic scissors in the production line; this law creates infinite characters in the ecosystem. Otherwise, there would just be one production and one output. On the higher

view, birth and death get new meanings and therefore human understands the necessity of death phenomenon. Man comprehends that he is a subset of a great system that follows a purpose. Since human lives in the present time, he can't entirely see every side of this story. Indeed, a tiny part of this story is just visible. Birth and death are the problems that involve mankind's mind. Furthermore, there must be an element for creating diversity (the law of birth and death) in the ecosystem.

**2. Behavior:** The material world is a living being. Since the universe is created from motion, it has produced numerous different behaviors. Every behavior goes after a direction. Behavior gets an identity which, eventually, reaches a real character (figure 4-1). Real character is something which has occurred. We can recognize one's character according to his/her behavior; it is real character which is the secondary and final production.

In the considered perspective, the first output of this production line is the material universe and the final output is character and character making. Sometimes a production isn't solely a final output. For example, real character of a screw is displayed while it is applied in a device or a machine such as a washing machine. Washing machine is the final production that is ready for washing. The material universe is similar to a washing machine that is prepared to execute something. Moreover, the ecosystem is an administrator in the universe which designs infinite characters.

In other words, an extraordinary factory is working. This factory makes lots of characters; who are (these characters) made for? What are they for? What is the ultimate aim (of this factory)? For instance, consider a factory that produces flour. It is questioned: "What is this factory's production?"

The answer: " its production is flour".

Afterwards it is asked: " what is the flour produced for?"

Then it is answered: " the flour is delivered to a baker and baker bakes bread. Human eats the bread and gratifies his hunger".

Then it is asked: " why is human going to gratify his hunger?"

Now it's asked: "why is human going to gratify his hunger?" So, we see that the final production is far beyond our imagination.

What has the ecosystem made the final production (of characters) for? What is the purpose? The main purpose is the creation of human being. Now, human is the final production. Why? And this is the big question.

There are many questions that must be answered by psymontology including, "Why has a factory of character-making been constructed?" The answer to this question removes many of the human's conflicts. Human isn't aware of his status in the universe and this is one of his problems. As a result, if human cannot find his/her status in the creation, he will face conflicts. Human may fall in conflict with God, with universe, or with oneself. Conflict is a causal factor for illnesses and disorders. Therefore, answers to these questions help human comprehend why he exists.

The next chapters explain the software-based setup. Indeed, these subjects should be considered the alphabet of this grand story, because the city of existence may not be depicted or described. Therefore, human is the ultimate aim in this story. Now, human should examine " who he is?"

## **Status of Human beings in the Ecosystem**

Ecosystem has designed infinite different characters in the universe after billions of years. In this cycle, the ecosystem has implemented various characters and behaviors that have been set in all beings including components, animals and plants. Ultimately, all these characters and behaviors have been placed in human's existential plan (figure 4-6). In other words, the final outputs of all characters and behaviors which are designed and executed by the ecosystem are placed in the set-up of man's existence.

Human owns the characters which are separately designed and implemented on animals by the ecosystem before human's creation. For example, nobility of horses, dignity of alligators, loyalty of dogs, fierceness and cruelty of wolves, desire to save foods by ants, desire to breed like bees, desire for parasitic living like leeches are transferred to mankind. Humankind can also activate or inactivate each of these characters in his being. For instance, termites have built structures before the creation of man. Termites have constructed 12-floor towers in which each floor is built for a special purpose. Insects have experimented every unique plan before the existence of human beings. We have inherited all soft wares which the ecosystem has left for us in the last billion years. Thus, we have lots of options to apply in our life. In brief, the ecosystem has intelligently executed a great job. What a marvelous mission by the ecosystem!

Figure 4-6. Status of Human beings

## Mutation and the law of Natural Selection

Mutation is one of the necessary ways that the ecosystem has intelligently applied to designing different characters. The world of science believes that creation of various characters has occurred by chance (mutation). Anyways, the ecosystem has intelligently been able to produce infinite various characters having unique status via the "mutation". No constituent can take the place of another constituent in this purposeful and organized universe. So there is an artist who has engineered the structure of unique and special

“being” known as "human beings". The universe and the ecosystem are planned so that all these indefinite behaviors and software are bestowed upon human. Therefore, there is an aim for human creation. Human is created to understand his existence. As long as human doesn't comprehend the aim of creation and doesn't know these soft-wares, he/she won't understand his greatness.

Therefore, Psymatology intends to find out human's status in the universe; it has an Interuniversal perspective. Psymatology attempts to discover the meaning of "the universe is human and human is whole the universe". Hence, we contain all the characters in the ecosystem. And the ecosystem embeds these properties so that the whole is equal to the partial. Now while this greatness is discovered, indeed the marvelous engineering has been revealed. Otherwise all the existence remains under the veil. Ecosystem is located below the Consciousness.

We seek for something through details. There has been character and behavior before the creation of human. Ecosystem is basically a character. When the Big Bang occurred, a behavior was created. And this behavior had a character, an identity and a direction before the appearance of human.

### **Ecosystem's Role in the Process of Faradarmani and Psymatology**

Nowadays humankind encounters various illnesses. Ecosystem has restricted man's activities by causing illnesses. Those who respect the laws of nature and try to protect the ecosystem are certainly supported by the ecosystem. But those who violate the laws are exposed to threats. As it was mentioned, the ecosystem executes the survival of nature and keeps a balance in the universe. Since human attempts to destroy the nature and exterminate the species of living

beings and disturb the balance of the universe, the ecosystem has fought against him to stop his grandiloquence.

Ecosystem must be protected for the survival of mankind. So, the ecosystem fulfils its mission to keep itself alive. The Consciousness governing the universe guarantees to keep the ecosystem safe and to provide surviving conditions for human beings. Consider if the charged particles could penetrate the atmosphere or radioactive particles were not entrapped outside the atmosphere by the Van Allen belt, no living being would have remained alive on the Earth. There are many intelligent laws and phenomena that assist the ecosystem in protecting the universe.

Furthermore, there are many reasons that cause genetic mutations and cellular alterations in human and other living beings. All these events lawfully occur in the universe. Changes are created due to various factors (physical and intelligent radiations and chemical effects...) which lead to new process of life. Genetic mutations and the law of natural selection demonstrate that the ecosystem has been planned for adapting to new conditions. Ecosystem has existence, intelligence and it makes no mistakes.

Human damages the nature for his/her profits but the ecosystem as a whole attempt to keep life in the universe. So, the ecosystem adds and deletes. Suppose that the balance of atmosphere's oxygen and carbon dioxide was disturbed, and then the polar icebergs would melt down. It might seem that this phenomenon causes disturbance in existence of species. However, this phenomenon actually retains life on Earth.

The death and life law guarantees survival in the ecosystem; if not, the Earth would have been overpopulated with plants and birds. Hence, human couldn't certainly find an empty space on the Earth.

Balance means death and birth. If there wasn't any death phenomenon, the ecosystem would have been in serious trouble. However, irregular death can destroy the ecosystem. Ecosystem ends the life of many beings in favor of survival of other beings. For example, the forest fire research has shown that the ecosystem burns the top surface of plant community so that the plants of bottom surfaces can grow. Humankind learns this from nature and makes artificial fires. Therefore, the ecosystem is artificially retained in balance and harmony; it seems that man is trying to accept the death phenomenon in the ecosystem.

However, if there is no regular plan for deleting beings and priority is given to human's temporary profits, the ecosystem suffers severe harms. For instance, consider if human kills all lions, tigers, panthers. (because these animals are fierce), you see other harmless animals annihilate the forests. These herbivore animals will eat every tree root. Lions, tigers and panthers help keeping balance in the ecosystem. Ecosystem determines natural survivals and non-survivals for all beings.

Ecosystem acts according to the simplicity law. When water flows from a spring, it is pure and clear. The farther water goes, the more impure it becomes. Thus, water becomes more and more complex as more ingredients and pollutants are added to it. Afterwards, water refinery operation becomes longer and more expensive. Similarly, human has been gradually seized by many types of illnesses. One of the main reasons is that at the beginning, man's mind was not complex enough for various illnesses to occur. Human should not confuse complexity with capability; nor should he/she think an intellectual is a complicated person. Actually, an intellectual seeks the quick and simple solutions. Intelligent people have resolved numerous complexities through simple methods. Spirituality, also

follows the same law, so that moving in the path of God is the simplest and the shortest. The closer human being is to the origin, the less complex his relationships with the source (origin) becomes. Ecosystem teaches moving towards simplicity; so the more complicated we become, the more the negative effects of these complexities would appear.

When a patient undergoes treatment via Faradarmani or Psymetology, his whole body is scanned. Then the ecosystem determines whether the treatment is performed or not. Although Faradarmani and Psymetology have a high efficiency in treatment, patient may not be fully treated. A few evidences have shown that some people are not treated in some conditions. In Faradarmani and Psymetology's treatment process, the ecosystem intelligently confirms the treatment procedure. Thus, it should not be expected that a patient who is placed within the ecosystem's intelligent field, is inevitably treated.

The role of the ecosystem in Faradarmani and Psymetology is so much that the effect of these treatments in different individuals is not virtually identical. For instance, different patients with similar tumors are healed differently through Faradarmani's procedure. This is an example that shows the ecosystem's role in executing the healing procedure (stopping cancer from metastasizing, eradicating the tumor). Ecosystem and its infinite components determine these healing procedures. Moreover, the ecosystem determines how long the treatment should be continued.

Furthermore, death becomes meaningful by the law of adaptation with the ecosystem. While the ecosystem declares the expiration date of something, nobody can do anything. If there was an absolute method for curing all the illnesses, the law of entropy, birth and

death would have been violated. Ecosystem only allows that an individual increases his lifespan coefficient by reduction of cellular coefficient. However, even if he lives for a thousand year, he would eventually encounter the birth and death law.

## **Chapter 5**

# **Human, Character and Behavior**

## **Human's Character and the Ecosystem**

As it was mentioned, character is the manner of appearance, presence and behavior in the ecosystem. In other words, character is the software that exposes each particle of the universe's components on the scene of the ecosystem. The manner of appearance, and manifestation and the type of actual for each member of the ecosystem is called behavior. Consequently, human's character as a member of the ecosystem contains all factors and behavioral programs. Character displays all human's properties in the ecosystem.

Character is a software program of behavior and it has many potentials. Behavior practically depicts a character which is actualized. It will be described true character here. True character is behind the scene on contrary to real character which is manifested on the scene. It is worthy note that there may be contraction between character (potential program) and behavior (actual program) about human beings. It might be possible that human doesn't accurately behave in accordance to the program of character.

### **True character**

True character is a part of human's character which has not yet manifested on the scene of the universe. True character follows two software programs:

- 1. The Programmed- Self Software:** it is human's primary character and it is born with him. The programmed- self software comprises various soft-wares. Every baby is born with a unique primary

character which is distinct from his/her parents' character. No two newborns have the same primary characters, not even if they are identical twins or twains created from apomixes. Baby's primary character follows various software programs which newborns bring with them into the world.

**2. The Programmable-Self Software:** it is human's acquired character. Environment creates this character; in other words, the programmable-self is planned by the environment.

The combination of these two soft-wares make human's true character (figure 5-1).

Figure 5-1. True Character and Real Character soft ware

## **Decision Making and Behavior**

Human makes decision on the basis of his true character. Behavior occurs after decisions are made. Behavior are reflected and manifested in the universe. For instance, human's mental behavior consists of his comprehensions of the universe, the emotional behavior is his feelings and the physical behavior is his motions/actions which are displayed in the existence. It's noteworthy that nutrition factor can interact with human's behaviors.

Decision making and behavior are divided into two parts (figure 5-2):

**1. Automatic Decision Making and Reactive Behaviors:** they are behaviors and reactions which are acted automatically, unconsciously, and without any thinking and pondering. In these types of behaviors, human reacts in accordance with the predetermined programs which are planned by him or by the environment. For instance, consider someone who receives unpleasant news by phone; thereafter he may show an immediate reaction to the news (he may faint or fall in hysterical paralysis). In this state, the individual does not certainly say: let me think what I should do now?

Human may be continuously exposed to a misfortune such as someone's death or a sound of an explosion; thus he must have an immediate reaction to these events. In fact, he has no control over his reaction if he has not already prepared himself. In other words, the individual does not have enough time to do an automatic decision making or a reactive behavior. He should have already defined a program for his reactions. Otherwise, he has to rewrite a proper program and reset once again.

**2. Scheduled Decision Making and Conscious Behaviors:** in some decision making, individual has enough time to think and program a proper reaction, so that he would not be shocked or harmed. However, there are different soft-wares which impact these reactions. So that individual cannot make a correct decision even if he has enough time. In other words, although an individual would examine the exclusive plans, the significant percentage of his decisions might be wrong. These decisions are filtered by some soft-wares, the soft-wares such as the defensive-self, the chief justice-self, etc. Therefore, Psymentology is the Interuniversal approach that assist humans for having plans for everything. Consequently, he behaves in a proper way to avoid troubles.

Figure 5-2. Automatic and Scheduled Decision Making

## **Insight-Based and Functional Behaviors**

External events pass through two soft-wares of “programmable-self” and “programmed-self” that respectively lead to insight-based and functional behaviors (figure 5-3).

In other words, external events pass through programmable-self (programmed by the humans, knowledge, beliefs related to culture, religion, mysticism, science, philosophy that are acquired from the environment). The events reach the true character, and then they are distributed to mental, emotional command center, the brain and physical reactions and finally it leads to an insight-based behavior. In other words, human’s insight results in his insight-based behavior. For example, an individual may be initially frightened after hearing an explosion. This happens because of his insight. Thereafter, adrenaline is secreted so that the body reacts. Therefore, an insight-based behavior passes through the programmable-self software in which the programs have been previously defined by man. This software interprets the defined programs into the mental perceptions and then into emotional language. Afterwards, a command is issued by the brain. Brain determines the intensity of reactions and finally our bodies react. Consequently, an insight-based behavior is displayed.

On the other hand, external events also pass through the programmed-self and are distributed to the mental, emotional, command center, brain and physical reactions. This kind of behavior is called functional behavior. The functional behavior is derived from personality types and existential structure. A newborn brings the functional behavior with him into the existence. The personality type is a software that determines different reactions of different groups

of people in different events. In other words, people behave differently due to their software-based types.

The collection of these reactions (insight-based behaviors and functional behaviors) form the behavior.

Figure 5-3. Insight based behavior and functional behavior

### True Character

Real character software is something that has appeared and occurred. In other words, real character is a part of individual's character that is recognized from different aspects, such as anxiety, excitement, disorder, abnormality and etc. (figure 5-1). But true character is behind the scene so that people cannot see this character. Indeed, it is the same for all constituents of the universe.

## **Programmed-Self and Programmable-Self**

The programmed-self is a collection of various soft-wares such as nature, foundation (the software which causes natural functions), institution, gene, collective soul, collective memory, and shared mother-embryo software. Furthermore, the programmable-self consists of various soft-wares. The programmable-self is affected by all environmental factors such as individual, family, education, society, government, international affairs and other programs as well as the real character. Non-organic viruses can also alter the programs of both the programmed-self and programmable-self soft-wares (figure 5-4).

Elements of the primary character in programmed-self include:

Nature

Foundation

Instinct

Gene

Collective Soul

Collective Memory

Shared Mother-Embryo Software

Figure 5-4. Programmed Self and Programmable Self

## Normal Character and Value Character

Normality is the individual's character whose behavior is adapted with the ecosystem and he has also found his place in the universe. Psychology may not define a normal character or behavior for an individual who has neither found his place in the ecosystem nor has recognized his existential dimensions. For example, the behavior of an orderly person who works well in society may seem normal; so that he is known as a cultured person. But the mental and emotional behaviors of this person may be considered abnormal in a superior level such as his city, planet Earth and the universe. For example, this person might break a tree branch in the forest causing disturbance in the ecosystem. Therefore, one's behavior must be evaluated in accordance to the standard level of defined normality that is regarded a normal behavior.

The ratio of real character to true character is defined as "value character". True character is what is ought to be, and real character is what it actually is. The value character is defined on the basis of the position where someone is located.

Value Character =  $\frac{\text{Real Character (Universe, Ecosystem, country, city, family self)}}{\text{True Character (Universe, Ecosystem, country, city, family, self)}}$

As long as the society's expectations from an individual are not determined, it would be considered a normal behavior. Anyway, when the level of expectations is specified, it's observed that individual's behaviors are mostly disadvantageous to the ecosystem. An Individual requires some minimal behavioral standards which are defined in the universe, in the ecosystem (in a country, city, family and oneself). Some examples of these minimal standards include:

The minimal behavioral standard to the universe: human must respect the universe.

The minimal behavioral standard to the ecosystem: human must respect the ecosystem. He must avoid any activities that cause the Earth to be in danger such as:

- \_ preventing pollution on Earth
- \_ attempting to expand the green spaces
- \_ avoiding the irregular consumption (gas, water...)

The minimal behavioral standard for a country:

- \_ contributing to self-sufficiency
- \_ avoiding the irregular consumption
- \_ attempting to expand the green spaces
- \_ ...

The minimal behavioral standard for city:

- \_ attempting for the improvement of traffic problems
- \_ paying attention to the public deficits such as water, electricity consumption and etc.
- \_ ...

The minimal behavioral standard to family:

- \_ respecting the spouse's rights and their relatives
- \_ providing facilities/welfares for every member of the family
- \_ attending to children's requests
- \_ ...

The minimal behavioral standard to oneself:

\_ All the normal behaviors

## **Chapter six**

# **The Programmed-Self**

As earlier mentioned, the programmed-self software is the human's primary character; it is born with him. The programmed-self comprises various soft-wares. Each newborn is born with a unique primary character that is separated from his parents' character. No two newborns have the same primary character even identical twins or twain created of apomixes. Baby's primary character follows various software programs which the newborn brings with him into the world. These soft-wares consist of the main software (nature), logic of creation software (the base logic), collective soul (collective reflection), collective memory (collective reflective memory), soul (guiding soul), shared mother-embryo software, foundation, institution, gene, chief justice-self, defensive-self (figure 6-1). These will be discussed later.

The primary character has been originated at the moment of birth. This discussion intends to state what has happened at the time of birth; what these cases are and where their origin is. Some believe that the factors acquired during pregnancy as well as gene are effective in formation of the primary character. There are other soft-wares which affected this formation. Some soft-wares such as the main software (nature) exist at beginning of the dipolar world's cycle (good and evil). However, many soft-wares are formed through this path. Each newborn brings some soft-wares with him by birth such as chief justice-self and defensive-self. These soft-wares exist at the birth time; at first they aren't activated but after a while they get activated.

It should be noted that non-organic viruses can exist while forming an embryo, or even can be transferred from each parent to the embryo. In other words, these viruses may exist in the programmed-self and this is resulted from the mistakes done in the previous generations.

Figure 6-1. The Programmed-Self and Its Soft-wares

## The Main Software (Nature)

Nature is the Motherboard of the human's existential computer, with CPU and Operating system installed on it. Similar to a computer, many programs must be installed on the human's nature so that programs can be processed and applied. There are the principles governing the main software (nature) such as freewill (tendency towards Positive or Negative), perfectionism, quality-seeking, questing, self-awareness, motivation, recognition, comparison and assessment/evaluation (figure 6-2). Moreover, the main software (nature) contains other soft-wares (figure 6-1).

Figure 6-2. Main Software (Nature)

## **Freewill Software**

The main software (nature) is important because it consists of two main parts which confuse human's mind. These two parts are:

1. Tendency towards Positive (Perfectionism-self)
2. Tendency towards Negative (Anti-Perfectionism-self)

Human's existential value and his destiny depend on the perfectionism-self and the anti-perfectionism-self. If these soft-wares were not provided for human beings, he might not have been aware of himself and the ecosystem. Thus he would have been settled in other places. Therefore, human is the only being who is aware of his existence. Hence, the existence of human causes the other motivations to become meaningful. Furthermore, knowing these facts, human being can resolve many of his mental conflicts as well as so many of his faults, abnormalities and problems that he attributes to external factors (such as the Negative Network). For example, he says: "evil deceived me", while the factors of tendency towards positive and negative networks are inside him. The outcome of all these happenings refers to something which has been set in human's existence that has created the other exceptional phenomenon known as freewill. The freewill correlates with the Motherboard. Thus the Motherboard (nature) is programmed via the freewill software. Consequently, human understands his duty and discovers that it is him who chooses whether to apply the programs or not. Indeed, human owns the freewill which can activate the perfectionism-self or the anti-perfectionism self. Therefore, he has to analyze the events to obtain proper results. In other words, by recognizing these matters, human can design the better plans.

## **Self-Awareness, Quality-Seeking and Questing Soft-wares**

Since it was told: "Don't go towards the tree," Adam thought of whether going towards the tree or not.

\_ So, it was required that he would have self-awareness software for being aware of his existence; thereafter he decided to approach the tree.

\_ It was required that he owned the questing software to choose whether to quest or not. If man was not a quester, he would not have gone after the forbidden tree.

\_ It was required that he owned the quality-seeking software to comprehend the quality of life. So that he thought, there is a simple and ordinary life in the Garden of Aden on one side and an adventurous life on the Earth on the opposite side. He would comprehend that the life in the Garden of Aden is eternal. Consequently, if he was not a quality-seeker, he would not have been happy for any given interesting offers. So, he would assume that everything was futile.

## **Recognition, Comparison and Assessment Soft-wares**

If Adam did not own the recognition software, he could not recognize the forbidden tree neither in the Garden of Aden nor on the Earth. Since human owned the comparison software, he could compare the ordinary life in the Garden of Aden with the adventurous life on the Earth. Had the assessment software been provided for man, he could evaluate that the life in the Garden of Aden was better compared to the life on the Earth. Therefore, human's freewill lost its meaning without the soft-wares of recognition, comparison and assessment.

## **Motivation software**

Although there are many soft-wares installed in human's existence, the motivation software causes human's motion. Hence, there must be an element and a motivation which make Adam move towards the forbidden tree.

## **Fundamental Talents Software**

Fundamental talents software is another software that has been defined in the motherboard (nature). These talents are activated differently in different individuals after a while. According to a general principle, a talent has been set inside human awaiting actualization. For example, human can become an addict because the capability of addiction has been set in his main software (nature). Therefore, it has been required that this capability is defined for human. Now he can choose to activate this capability or to keep it inactive. If a capability or talent has been provided for human, a switch is certainly defined for it. Thus, man can turn this switch on (activate) or off (inactivate). Indeed, he owns infinite switches for each talent inside of him. It is impossible that human can add a new talent to his motherboard that has not been programmed earlier. In other words, human cannot act beyond the Creator's power. For example, he cannot say that the Creator has forgotten designing a special talent inside him (such as the capability of addiction or musical talent). Human is not the creator and designer of his talents and abilities, but he has been created with these talents inside him. He is a user. Man is born in a position which can positively or negatively change.

## **Logic of Creation (Base Logic)**

For a Motherboard to be defined it needs a program. This program is known as Logic (discussed in the Informatics). It means that if the Logic of Creation is not defined for Adam, it will not be clear what motherboard is installed inside him. In other words, Adam's Motherboard is defined on the basis of his determined duty/mission in this world. Consequently, there must be logic of creation before installing the motherboard software. At first, the aim of Adam's creation is determined and then a proper motherboard program is designed for him. Afterwards, other programs are defined for him. So, he activates each of these programs and applies them to his life. In fact, the Logic of Creation Software is one of the complexities of this extraordinary design (mankind).

The reason for considering the base Logic software is that Psymatology cannot present the appropriate solutions without knowing the facts. When some facts cannot be identified, the offered solutions would be limited to a small framework. Since this small framework is temporary, its efficiency is manifested in a small scale. Therefore, if we discuss human behavior and character in a superior level, many facts must be clarified. There are different viewpoints/theories that examine the short-term programs. It is also good that a viewpoint examines the superior fact about the existence of human beings.

## **Soul Software (Guiding Soul)**

There must be a general compass on the system installed in the Motherboard. For example, consider an airplane that remains balanced and static by the rudder through the flight path; at the similar state, human must also have something like this rudder to keep his balance through his pathway. Soul Software acts like a

rudder for human being. This software has been designed to show human the direction of his path. Soul Software helps human keep his balance in all stages of his life. In other words, the soul software is the general identity of human and it shows him the general direction. This software defines the return to God. If there was no soul software as human identity, human would have had no direction. Thereby, the general identity and ultimate direction are reflected from the soul software.

Everyone has the feeling of "having lost something" that is originated from the soul software. This software determines an expiry date for every enjoyment. For this reason, human does not feel complete satisfaction while achieving a desire and he still feels that something is missing inside him. Therefore, human finds the earthly materials futile after achieving the earthly goals. So, he attempts to choose something else for reaching satisfaction. More precisely, if human pursues earthly pleasures (materialistic) and does not respond to his inner desire for perfection (that exists in everyone), he will not be satisfied after achieving these desires. He reaches satiation after a while and looks for another purpose. But contrary to earthly enjoyments which are limited and temporary, spiritual desires are endless. Spiritual desires not only do not lead to aversion but also increase the individual's enthusiasm. Soul Software leads humans towards perfection via these two opposite feelings (materialistic and spiritual desires).

The soul software includes the following principles:

Principle of **feeling lost**

Principle of **desire for non-repetition**

Principle of **desire to ascend**

## **Collective Soul Software (Collective Reflection)**

The collective soul is similar to a spherical mirror while each individual is located at the center of this mirror. All human's thoughts and radiations are reflected back and intensified upon him through this mirror. For example, suddenly an economic thought is spread among the individuals of a society. So, the fever of this story catches everyone. Thereafter, everyone is affected by this economic fever and learn how to increase his wealth. The collective soul consists of several subsets such as collective souls of a family unit, a village, a city, the planet Earth, animals, and so on. Each of these collective souls acts independently and has one overall and ultimate reflection. The entire universe is the reflection of all thoughts and radiations that have occurred.

## **Collective Memory Software (Collective Reflection Memory)**

Collective Memory software registers records and saves all events and experiences that occurred through billions of years. For example, man is still afraid of the darkness and loneliness; but he has resolved his problem with darkness and loneliness. This fear is recorded in the collective soul. All these fears go back to the time when there was no method to light the night. Thus all humans were afraid of darkness and loneliness. They felt that they could protect themselves when they gathered together. Today, "collective memory" is sometimes called "collective unconscious".

## **Shared Mother-Embryo Software**

All the information related to mother's mental, emotional and physical actions and reactions during pregnancy are stored in the shared mother-embryo software. This software is activated when the child is born. There are some emotional states of mother during

pregnancy such as feeling aroused after listening to music, feeling scared, anxious and angry that produce the chemical changes in that mother's blood, impacting the unborn baby. Moreover, disorders could be transmitted via the software to embryo and can cause cancer or other problems after birth. For this reason, there are differences between the offspring who is born in wartime versus the one born in peacetime.

In other words, a mother's interests and problems in the period of pregnancy are stored in a shared software. Some psychologists recommend that mother should talk to the embryo during pregnancy. At any rate, the embryo does not possess the mental and data set-up, memory management and many other soft-wares. Indeed, in this process of development, the embryo knows nothing. However, experience has shown that talking to the embryo is effective. Thereby, all data received from parents (the talking, the environment, etc.) are registered and recorded in the shared mother-embryo software. This software is activated after birth.

### **Foundation Software**

Foundation is software that defines the beings' function. For example, when a baby is born, he/she starts crying. Furthermore, he knows what he should eat and how to eat it.

A baby turtle, after breaking out of its egg, makes its way from the nest to the water. The baby turtle instinctively goes through all stages of advancement. Everything in this universe is informed about its duty, so that this knowledge is put in its system. For example, a particle's function is to join other particles, absorb energy and etc. Consequently, the Interuniversal Consciousness has designed something which defines the function of everything. There are the

principles governing the foundation such as the principle of struggle for survival, the principle of the diversity and etc.

The foundation software comprises of two parts:

### 1. Instinct Software

The instinct software responses to the vital/natural needs

### 2. Functional Software

The functional software follows the principles embedded in human beings. Human's functions are under the influence of these principles. In other words, this part of foundation software determines the base of human's behavioral programs. Some principles of this software are explained here (figure 6-3).

Figure 6-3. Principles Governing Foundation Software

It must be mentioned that activating the principles managing the foundation and their intensity or weakness in different people depend on other individual's program.

### **\_ The Principle of Obtaining Results in the Shortest Time**

Human looks for obtaining results in the shortest possible time (the principle of haste). This software is programmed in him. If this principle was not programmed in man, all his motions would have been slow. Accordingly, the essential inner motivations and programs are designed to expose the "being" of human. However, there are some soft-wares which determine how to apply these programs in the best possible way.

For instance, a car is designed and produced to reach the top speed of 300 kilometers per hour. Yet, a driver does not even surpass the speed limit (100 km/h), unless he wants to overtake another car; so, he uses his car's capability. Similarly, the existence of human is designed with every capability. If each of the above considered-principles were not installed in human being, human could not have entered the story of life. For example, making a "hurry program" is effective when human applies it in a proper occasion. He must actually manage this program (the programmable-self) and know when and how to use this capability (like a driver who has to recognize when he can apply the capability of the car's top speed). In other words, a car factory has adjusted this capability (top speed) for an urgent occasion.

Similarly, human needs to analyze his existence considering the institution software. Thus he can manage his capabilities because all these capabilities pass through the institution filter. Moreover, the institution software identifies the intensity and weakness of exerting capabilities.

## **\_ The Principle of desire for Least Energy consumption**

There is an inner factor in the human existence that causes him to consume the least energy. For example, in the earlier times (many thousands years ago) human could hear an inner voice while carrying something on his back; the voice said, why would he not build a wheel to facilitate his jobs and help him consume less energy. This inner factor motivated human to search and invent wheels. So, if there was no motivational factor, human would have never thought of inventing something. In other words, human has certainly owned an inner motivational factor that has helped him produce things. Moreover, other capabilities and facilities have facilitated the human life. For example, the facilities like elevator and automatic doors are produced so that human consumes less energy. In the future, human may invent something so that his working conditions become even easier. So, the principle of desire for the least energy is an effective software-based element.

Nevertheless, when human reaches the level of low energy consumption (such as using elevators), his return to the previous conditions becomes hard. Thus, he does not enjoy his previous conditions and refuses to go back to that state. For example, consider the residents of a building without any elevators. They easily walk up the building stairs. Afterwards, if this building is equipped with an elevator, then everybody prefers to use the elevator. Now, the residents of this building get used to the elevator. If suddenly they cannot use the elevator, they would start complaining. Nowadays, numerous people are addicted to driving, so that if one day they do not have a car, it will be a hard day.

## **\_ Principle of desire for the simplest energy**

According to this principle, the sooner the energy is taken, the faster it is absorbed. Human's cells and body need this kind of energy. For example, compare the energy produced from sugar to the energy produced from meat fat. When human's biological system gets accustomed to simple forms of energy, his body will not desire to absorb any form of complex energy. Hence, the principle of desire for the simplest energy is clearly seen in cases of addiction. Thus, when the body gets used to doping, it will use this kind of energy so that he does not desire for any complex energy.

## **\_ Principle of self-preference**

The principle of self-preference is software that is saved in human beings. It means, each baby has narcissism (excessive self-admiration and self-loving) at the birth, thus he/she wants everything for himself/herself. In other words, nothing is important for the baby except himself. He even wants his mother to feed him and care for him. The principle of self-preference encompasses three principles:

- 1. The principle of Monopolism**
- 2. The principle of Profit-Seeking**
- 3. The principle of Appreciation-Seeking**

**The principle of Monopolism:** according to this principle, everyone wants everything for himself at the birth. This principle always governs humans; everybody is inevitably affected by this principle. Thereby, human has to rightly manage this software to get the positive alterations. Otherwise, he is born in a monopolistic state and thereafter he will die in that same state, too.

**The principle of Profit-Seeking:** according to this principle, human wants everything for his profit at the birth. Thereafter, this principle has an important role in human's decision-making whether he applies his profits for reaching perfection or power, etc.

**The principle of Appreciation-Seeking:** according to this principle, human needs admiration and appreciation (the second type of energy). When an infant is said that he/she is cute and pretty, he shows the happy reaction; although he is not too old to understand the meaning of these words. All the children need to get their parent's attentions/ cares. It seems that these cares are the children's psychological needs; but how long these attentions have to be continued is important.

### **\_ The Principles of Pleasure-seeking and Pain Avoidance**

These two principles are the general principles in the foundation software that are set in everybody's existence. These principles that are similar to engines play the main roles activating human inner motivations.

### **\_ The Principle of Insatiable Desire**

This principle, like the above principles, is an inner inducement. According to this principle, human desires to possess everything. There is no end to his wishes. If this principle were not programmed in human beings, he would have been satisfied when achieving his first wish. Since he has to continue his journey, he needs to search for everything. So, the insatiable desire software is activated to respond to human's endless wishes. There is a software that induces humans to wish for something so that he demands from God and from others. Subsequently, the other soft-wares become activated for different demands. These soft-wares do not belong to the

foundation software. Human existence is like a system that is organized via these principles.

What is human's duty? He must manage and properly apply his capabilities. If he cannot manage his insatiable desire, he will encounter problems. Thus, he will lose his tranquility and health and will suffer the false and negative excitements.

### **Some Outcomes of the Principles Governing the Foundation Software:**

#### **Lying:**

One of the outcomes of the principles governing the foundation software (the principles of appreciation-seeking, profit-seeking, avoiding pain, desire for insatiability and etc.) is lying. For example, if a child is blamed for his wrongdoing (he is deprived of the principle of appreciation-seeking), he says, "It isn't my fault". Although the child does not still recognize the meaning of "it isn't my fault", he still says this sentence. This child is too young to understand what he is saying. Indeed, the soft-wares perform these programs, so the lying mechanism becomes established in humans. In other words, children are not often aware of the lying mechanism. Nonetheless, they lie before they learn it from their parents or from the society because they have the inner factors that cause them to lie. These inner factors are affected by the principle of profit-seeking and etc.; therefore, children lie for their own benefit. For example, according to the principle of appreciation-seeking, they think if they do not lie, they will not be appreciated or they may suffer pain.

Parents do not actually teach lying to their children. They (parents) themselves lie, too; because they are still affected by this software. Parents have not managed the lying software. Moreover, all the soft-

wares of monopolism, profit-seeking, insatiable desire are still activated. In other words, these soft-wares have not still been improved. Human is born with these soft-wares but he has to manage and improve them before death.

### **Habits and Addiction:**

There are some principles (the principles of desire for the least energy consumption, desire for the simplest energy, desire for pleasure, desire for pain avoidance, etc.) and genes that are effective in habit-formation. For example, an infant likes his mother for breastfeeding, meanwhile he feels comfortable in his mother's lap. Thus, if someone separates the infant from his mother, the infant feels the unease. So, the infant experiences these issues (habits and addictions) at the beginning of his life. Indeed, the addiction is a subject that is widely discussed. Hence, nobody exists without any addiction or habit in this world. Habits and addictions may include the addiction to tea or to napping after lunch.

There are two parts designed in human beings. One part acts like a machine (car) that includes the human's physical body; the Creator has considered a specific aim for designing this part. But the other part (self) does not act like a machine. So, the mechanical (materialistic) and non-mechanical (spiritual) parts of human existence must be associated together.

As earlier mentioned, in the example of a car with the top speed of 300kl/h, one driver can appropriately use the car's capabilities while the other one may be killed for his incautious. The machine factory has designed and built this car for those who intelligently apply this car's capabilities so that the machine builders get proud of building the car. This machine needs a good driver who utilizes its different capabilities.

Therefore, there is no error in creation; and all the capabilities are designed so that human being manages them. So, the designed capabilities have to be organized, identified and applied. Human is affected by every type of addiction that can often create the defective data cycles. Furthermore, the addiction, like a computer virus influences human's organs. Consequently, since many years ago, there have been several methods such as fasting offered for breaking the bad diet habits and many types of addictions. The reason is that human as the driver can control the car of his existence.

In brief, all humans live with their habits so that there is no human with no habit. Everybody owns different habitual soft-wares which must be managed. There are some habits that human is not aware of. One of the main methods in Psymtology is to improve the software-based programs. So, a program sometimes needs to be removed and the new program replaced. Therefore, it is important that someone recognizes himself/herself.

All these principles are installed in human beings and determine his functions. Nevertheless, if these principles are not controlled, managed and properly applied, they may cause human's misfortune. So, human as a driver of this car (his body) may get into trouble.

In spite of the fact that primitive man did not need the program of "hurry" and many other programs, all these programs are set up inside human being. In other words, it is impossible that a software-based program is not designed in humans and be programed and activated by humans. For example, photography tool set on a cellphone provides the facility of taking photos. Similarly, human applies the programs which are already installed in him/her. The primitive man has owned all the programs that have gradually been

activated. For instance, desire for greediness may be stronger in this generation compared to the upcoming generations.

## **Institution Software**

Institution software (known as origin) is one of the software-based programs of the primary character that determines the fundamental temperaments. This software is born with a baby. The institution software consists of the software-based personality types. It should be noted that the personality types are divided into two general types:

**1. The hardwired-based personality type:** everybody is born with some genetic traits such as outward characteristics (facial features like the hair color). The hardwired-based personality consists of the temperaments of choleric, melancholic, sanguine and phlegmatic (personality types of Vata, Kafa, and Pita known in Yuga).

**2. The software-based personality type:** it refers to the individual's inner soft-wares which are activated after birth. The software-based personality type determines the individual's talents, behaviors, tendencies and attitudes. The software-based personality type defines the fundamental axis of individual's behaviors through his life. This software-based type passes through the institution software installed in self-programmed. The software-based personality type is not inherited, and is not genetically-based. For example, the children of a family have different original personality types even if they are identical twin or the twains reproduced by apomixes. In other words, children of a family share common hardwired personality types.

The institution software consists of four software-based personality types that play an important role in the formation of baby's primary character:

- \_ The software-based personality type 1 or A
- \_ The software-based personality type 2 or B
- \_ The software-based personality type 3 or C
- \_ The software-based personality type 4 or D

All human beings own a degree of each of these four software-based personality types within them. Although these four personality types have separate descriptions, there is no border between them. An individual may possess a dominant personality type or a combination of the four software-based personality types. There are some reasons why these personality types are broken down into four categories.

By identifying these software-based personality types, many behavioral disorders are easily justified. Each of these personality types shows different reactions while encountering each problem. For example, the hardwiring of addiction is differently exposed via each of the software-based personality types.

Children of a family may have common traits because of the hardware-based personality type (facial feature /appearance, etc.) but the children are functionally different (their thoughts and their inner temperaments). For example, the principle of monopolism may differently appear in different generations and this difference is rooted from the institution software. The institution software determines the intensity and weakness of the genetic software-based issues as well as the foundational software-based ones. Indeed, these issues initially pass through the institution software.

As mentioned earlier, those personality types which influence the functional behaviors are embedded in the institution software. Afterwards, there exist factors that determine an individual's

reactions to the events. In other words, individual's behaviors are performed according to his software-based personality type.

The descriptions of four software-based personality types, are as follow:

### **\_ The Software-Based Personality Type 1 or A**

People with the software-based personality type A are flexible, adaptable and sociable. They are compatible with all individuals in different age groups. They are interested in cooperation. The people with the personality type A are so orderly and follow the classical routines. These individuals may have a high social growth through the in-school schedules. However, they are not creative persons; they are solely the good programmable ones.

The infants with the software-based personality type A are of the calm babies in nursery school so that everyone except their family can easily take care of them. As these infants become adults, they often choose monotonous jobs such as employment in a monthly-based wage/regular salary. They enjoy a consistent life. These individuals do not easily get bored of tedious and repetitive tasks. These people are the best staff because they are respectful to the rules. They automatically do their tasks well.

The people with the personality type A tend to be loyal to their family as compared to the other personality types. They are conservative, far-sighted, as well as joyful in making definite plans.

Tendency toward peace and flexibility are the important traits of people with the personality type A. Since they are characterized by the element of earth (soil), they like to please everybody and avoid annoying people. Thus, they are under heavy emotional pressure and are most susceptible to the psychosomatic diseases. People of this

group often feel distress, worry and anxiety. They are afraid of any events that disturb their tranquility.

The smart and intelligent people with the personality type A actually possess an apparent intelligence or wisdom. They orderly practice their educational schedules. The diligent students who are known as genius in the educational system are placed in this personality type. In fact, they act similar to a memory machine that just memorize, remember and apply the data. They do not activate their inner intelligence nor their creative abilities. Indeed, the famous scientists and inventors are not classified in the group of the diligent students and they are not certainly genius people.

### **\_ The Software-Based Personality Type 2 or B**

People with the software-based personality type B have a tendency for inspirational and intuitional capabilities. The power of creativeness and innovation are so strong in these individuals compare to the other personality types. The students with this personality type accomplish the innovative works, handicraft, essay-writing and the activities which need high imaginative faculty. But they are not successful in doing the classical and stereotyped affairs. They enjoy the initiative activities that are their favorites. Thus, when this group gets low grades in school, they get blamed. The classic educational systems cannot understand these students and thus mock them.

Since this group of people often travel in their imaginary world, it is difficult to live with them. Therefore, they show special gestures, postures so that nobody can sometimes bear them.

The children with the software-based personality type B enjoy imaginary games. They like to think abstractly about the things that

only can be imagined. In other words, these groups of people have their special imaginations and visionaries in the childhood age.

Artists, poets, musicians, inventors, discoverers, designers and intellectuals who have the soft/delicate feelings belong to this personality type. These individuals are eager to express themselves before a group to become popular. They would like to draw everybody's attention to them. Thus, they enjoy to appear in different facial figures, for example, some of them would like to have a goats-beard.

This group of people look for the conditions that are understood by the others; so, they are adjusted to the environmental and family conditions while being supported. If someone cannot understand their romantic, idealistic, loving, sensitive and touchy temperaments, they outburst and seclude themselves. For this reason, they may not have a prosperous life so that they choose loneliness. The people with software-based personality type B are very susceptible to feelings of loneliness, seclusion and probably suicide compared to the other personality types.

This group of people would like to remove their conflicts alone. For having the strange and unfamiliar thoughts they prefer to plunge into their visionary world.

The people with this personality type B are more susceptible to the diseases such as autoimmune diseases, any kind of cancers and mental disorders than the other personality types. This group of people tend to have fruitful conflicts so they are severely involved with the know-hows and want to discover why the conflicts are produced. Consequently, conflict is the great factor that makes them suffer from diseases. Thus, answering questions risen from conflicts can be the best therapy for ending their diseases.

This group of people tend to be calm. They may seem that have low apparent intelligence but they possess high inner intelligence. Therefore, the most intelligent people are placed in this group so that they own the effective genius.

### **\_ The Software-Based Personality Type 3 or C**

People with this type of personality are energetic individuals. They are restless so that they seem to tread on air. They are so active and cannot sit on their seatS for a long time. This type of personality is adventurous and curious so that it likes to know about everything. Taking care of children who have this personality in kindergarten and school is very difficult; later in life, these children who are now adults, have difficulties sitting still in an office or any fixed place. They turn from one activity to another in quick succession so that it seems that these individuals have little perseverance. Since they have frequent fluctuations of mood, they tend to look for frequent alterations thus they are so diligent.

The people with this personality type seek a new experience because they are not interested in doing repetitive works. The routine jobs irritate these individuals so that they try to avoid monotony. Thus, they choose jobs which are not limited to one place such as working in supplies department, driving a truck, pilotage, tourism and immigration. This group of people easily feel futile if they are not absorbed by something meaningful and exciting. They are quicker in changing their jobs, applying for a divorce and any other changes. They easily ignore a special position and welcome the new experience.

The software-based personality type C refers to individuals who are restless, pestered and hasty. They seem to be intelligent while they actually possess an average intelligence.

This group of people prefer activities requiring pep and energy otherwise they feel bored. Thus, they are active on their day-offs, too. These individuals suffer extravagant moods; for example, if they become interested in a something they become attached to it and cannot let it go. Their feelings of love and hatred are out of ordinary. The individuals with this temperament are susceptible to smoking, alcohol and etc.

### **The Software-Based Personality Type 4 or D**

People with the software-based personality type D possess high energy. They are very restless, nervous, irritable and rude. They are a ball of a fire like a volcano which is ready for eruption. Children of this type of temperament are often busy doing something destructive so that they surprise their parents for their destructive genius. They are satisfied with destructive planning as well as annoying others. They are naughty and own a high visionary faculty. No society can comprehend these children so the children are named, "bad-hearted children". When this temperament is considered as a software-based personality type D, everybody understands how to behave toward this personality type.

Members of this category are well-experienced, brave, rude and impetuous, domineering, excited, and easily angered especially when a condition does not satisfy him.

Most people with this temperament (which is located in the self-programmed software) are affected by self-programmable software in adulthood. Many of their destructive tendencies are altered via defensive-self (psychological defensive reaction) and turned into positive attributes. When the self-programmable software does not design an effective program, this group commits a misdeed and becomes known as felon-by-nature.

This group of people who are eager to be evil easily exhibit mischief. They freely express their wishes; they are frank thus they have low quantities of dual morality. This personality type produces the least negative potential energy so they become less susceptible to psychosomatic and metasomatic diseases. Moreover, they suffer from less diseases related to intelligence disorders. Consequently, the people with this temperament are physically healthier. It is observed that these individuals are apparently intelligent while they possess negative inner intelligence and creative faculty. In this category, individuals design destructive genius projects. In other words, people with personality type D own destructive genius in contrary to people with personality type B who own the constructive genius. These people are often carefree, non-obligator and unpunctual. They care little for the feelings of others, have little regard for others as well as not having self-sacrifice. They are often impolite and impetuous. They are the best in defending their rights and desire to being dominant.

Table 6-1 shows primary fundamental temperaments (in different age groups) and intelligence status in different software-based personality types.

Identifying different software-based personality types in children is very important. An educational system should recognize how to behave with each of these personality types because each of these temperaments has different reactions toward different behaviors. Each of these categories (A, B, C, D) needs different training for developing talents and skills; somehow these group's intelligence appears on the special border. For example, appearance of the intelligence in people with personality type B is based on imagination. Therefore, each educational system should identify how to use the capabilities of each category.

Table 6-1. Primary Fundamental Temperaments (in Different Age Groups) and Intelligence Status

	Type A	Type B	Type C	Type D
Newborns	Affection-Seeking, Compatibility, Monotony	Seclusion-Seeking	Change-Seeking	Superiority-Seeking
Infants	Desire for drawing others' attraction	Tending to Imaginary Games	Tending to Energetic Acts and Changes	Tending to Destructive Actions, Irritability and Misdeed
Adolescents	Tending to Classic and Orderly Behaviors	Desire for Receiving revelations and Doing Visionary Acts	Tending to Adventure and Gaing New Experiences	Tending to Transgression and aggression
Youngs	Tending to Classic Prosperity	Tending to Extravagent Behaviors such as Suicide	Tending to Advanture and Addiction	Tending to Immorality and Annoyance
Middle-ages	Tending to Dual Behaviors and Repetitive Actions	Tending to Creativity and Innivation	Tending to Questing, Changing and Divorce	Tending to Evil and Domineering
Intelligence State	Apparent Intelligence	Inner Intelligence, Positive and Constructive Creavity	Apparent Intelligence Seems creative	Inner Intelligence, Negative and Destructive Creativity

The main factor of human's conflict refers to lack of balance among his multiple behavioral tendencies. These behavioral tendencies are programmed in the institution software and are with man from birth. Each person may possess a dominant character and a reaction associated with it. These characteristics include seclusion-seeking, superiority-seeking and affection-seeking. They respectively exhibit reacting behaviors of elusion, aggression and adaptation. Individuals with seclusion- seeking temperament tend to be far from any disturbance otherwise they suffer from inner agitation. One with superiority-seeking temperament desires to carry strong control and authority so that if someone is not a domineering, the superiority-seeking person will be defeated and disappointed. An individual with affection-seeking personality is hurtful because he/she needs to get other's attention, thus this characteristic is his foible. Thereby, this fact is important that a healthy personality establishes a balance among these three tendencies and the reactions associated with them.

### **Healthy Institutional Software**

Human is a combination of these four software-based personality types (figure 6-4). There should be a proper formula that establishes a balance among each of these four temperaments. This imbalance is not considered a disease but instead it refers to establishment of a balance among the main borders of the personality types. For example, consider an individual with personality type B whom after establishing the balance is affected by a depression. This depression is not a disease (does not spread all over his body) but it occurs when three personality types become balanced; these 3 types attempt to control the fourth type thus individual feels a consistency in his body.

Figure 6-4. Healthy institutional software

As an individual with personality type A cannot accomplish works related to supplies, an individual with personality type C cannot work behind a table like an employer. In other words, the personality type A is solid in positions that need steadiness and are the best in their jobs while people with personality type C cannot sit on their seat for a long time. Thus, these two personalities annoy each other unless they get balanced and can understand each other. Indeed, none of these four personality types alone, is better than the other; So that they find meaning after making a balance among them.

Psymatology is able to create changes in the institution software programs according to the law of change and the principle of alteration. So, it is anticipated that human can change his/her incorrect programs. Human comes to this world to reach a good ending even though he possesses an evil temperament. Therefore, he is so hopeful that moves toward perfection and enjoys the divine mercy. Consequently, in psymatology's viewpoint, human is alterable so that he can continuously create a positive change within him. Nevertheless, negative changes are readily created because the institution software automatically follows negative changes while reaching positive changes requires more effort.

## **Chief Justice-Self (Special Court)**

Chief justice-self is a software which exists at birth but it is not activated. Defensive-self or special court is located in the subconscious and acts on the base of self-assessment system and punishes individual who offend his duties. The accused person is condemned and as a result suffers a disease by this court for issuing the negative potential energy. This kind of disease is called psychosomatic disease that is known as disease related to special court in Faradarmeni and Psymatology. This court accepts no defenses from the accused because according to the creation philosophy, this court believes that human is not created to produce negative potential energy. The negative potential energy is a complex of all negative energies which is produced by moods such as agitation, suppression, introjection, worry, sorrow, feelings of unsatisfied, failure, fault and etc. One of the main factors in producing negative potential energy is dual behaviors.

Dual behaviors comprise a significant part of human behaviors (pretense, tolerance, suppression, adaptation, etc.) that help him to be compatible to the environment. Otherwise, these behaviors lead to the production of negative potential energies and eventually psychosomatic diseases. The special court takes into account the outcomes of negative potential energy, then it condemns the offender to suffer any kind of disease based on the amount of issued negative energy. Individual with this kind of disease may suffer from a physical illness.

In other words, human has to do dual behavior when he tries to be compatible to the environment and the outer events. Thus, this behavior does not often satisfy him; so he becomes angry, worried, and sorrowful and etc. Afterwards, individual is condemned via the

special court when negative energy is produced in high amount. At last, he is sentenced to suffer a disease (figure 6-5).

Figure 6-5. The Special Court

Some of the current diseases related to the special court include:

Suppression: Gastric Ulcer

Agitation: Heart diseases

Sorrow: Goiter

Conflict with environment: Colitis

Conflict with oneself: Acne

As mentioned, the special court basically functions according to self-rewarding and self-punishing systems that judge the individuals based on their neglect of good/divine duties. This court demonstrates to human being who is created for a superior purpose

not to be agitated, suppressive and sorrowful. /this court demonstrates human beings that he is created for a superior purpose rather than agitation, suppression and sorrow. The special court accepts no reason presented by human for issuing negative potential energy in the universe. Therefore, recognition of human beings can prevent issuing the sentence/verdict of suffering diseases. Indeed, the special court may not convict human if he does not commit a fault.

### **Defensive-Self (Second Mother, Psychological Defense Reaction)**

Defensive-self is a software which exist at birth but is not activated. Defensive-self or second mother is the most important part of subconscious that provides compatibility with the environment. This software considerably decreases instant tensions and distress. Since the defensive-self software does not follow a logical behavior and is a kind of escape of reality, this software is accompanied with a self-deception. The defensive-self acts like a mother who lovingly defends her child. So, although applying this software becomes a necessity, it may be very hurtful for human beings.

The defensive-self inclusively defends an individual like a defending attorney or a mother. As a defending attorney is sometimes aware of his client's unrighteousness, the attorney defends his client according to his duty. Similarly, a mother ignores many issues such as justice, honesty and dishonesty in order to defend her child. She just thinks of protecting her child from a dangerous situation. The defensive-self acts like a mother so that an individual bears the least amount of distress in a risky situation.

The defensive-self performs the following services for protecting an individual:

## 1. to Prevent appearing tendencies/desires

\_ Repression: it is psychological major and common method for changing psychological realities. Repression is a defense mechanism made by an individual to push unpleasant thoughts and prohibited desires from his consciousness. He tends to repress memories of shame, guilt, disgrace, lack of self-acceptance and other emotional memories. Yet mind is an editor, it can also delete all experienced events and reorganize new experiences. In this level of defense, thoughts, emotions, memories, desires and fears are held in the unconscious level.

## 2. To escape from the elements creating desires

\_ Return: an individual takes shelter to his/her previous behavioral patterns such as speaking like a child.

\_ Denial: it is a refusal to accept reality or fact, acting as if a painful thought or feeling did not exist. For instance, when someone who misses his/her beloved person will deny to accept this painful fact. While suppression eliminates inward facts, denial removes disturbing outward facts. Denial often occurs when an individual feels threatening about his safety and being beloved. This mechanism appears when someone is threatening with death.

\_ Fantasy: people often use fantasy as a way of escaping a painful reality.

\_ Dissociation: this mechanism attributes to dissociation of some thoughts and actions from conscious level and disconnection from the real world for a time. For instance, consider someone who after a terrific car accident remember nothing.

\_ Avoidance: an individual avoid dealing with cause of stressful elements like someone who has a fear of heights and prefers to leave it unresolved instead of confronting it.

### 3. Changing identity of desires

\_ Reaction formation: in process of editing experience, individual may delete a part of the experience afterwards replace its opposite. Sometimes someone says: " I love him/her" when in fact he/she intends to say: " I hate him/her". This defense mechanism is called reaction formation. Thus, the person may form an opposite reaction to first impulse. So, he is incapable of expressing his negative emotion of hatred with someone else. Therefore, an individual's reaction contradicts his original feelings and desires. For instance, a man who has a strong tendency towards other men may instead express his hatred to the male sex.

### 4. Concealment of source of desires

\_ Introjection: this mechanism is the severe kind of identification mechanism so that an individual internalizes the values and characteristics from another person or group. For instance, someone may involve in his/her spouse's disease after his/her death. Or mannerism of a father may observe by his son.

\_ Projection: projection refers to individual's thoughts and impulses attributing onto another person. In this mechanism 'you' replaced 'I'. Projection is contrary to injection so that an individual attributes his undesired thoughts, emotions and tendencies onto another one. For example, someone who hate a person thinks that person hate him.

\_ Rationalization: this mechanism occurs when someone attempts to justify his inexcusable behaviors or feelings. For instance, when an individual is laid off, he may make excuses that he did not flatter his

boss. In other words, rationalization is a process of attributing the norms of society onto one's blameful behaviors. For example, when someone comes late to a party and he does not like to be there, he creates a common excuse and says that his car was broken down. These excuses are rationalization. Another example is: "I cannot fulfill this job not to because I am afraid of failure or not to be the best for fulfilling this job, but I feel I'm not ok". Tendency to the rationalization mechanism is often enhanced by inducing other's positive reactions.

\_Sublimation: it refers to a process of redirecting psychological energies from socially unacceptable purposes into acceptable and effective. Behaviors such as love, philanthropy, and even joking are conversion forms of original sexual and quarrelsome impulses. In other words, sublimation is a redirection of socially unacceptable thoughts and impulses into more acceptable purposes. For instance, someone who possesses quarrelsome tendencies tends to boxing.

\_Undoing: this mechanism is applied to undo an unwanted action in order to protect ego from feelings of guilt or shame. For example, someone who badly behaves with his spouse buys a gift to apologize from her.

\_Identification: this defense mechanism demonstrates a process in which an individual castrate other's character traits such as their thoughts, values, gestures, authorities. Identification is the opposite of projection. This mechanism is a very common method for affecting fear and inefficiency. In other words, identification includes patterning and emulating someone's desirable behaviors. For

instance, someone is interested in cinema which is his/her beloved favorite.

## 5. Self-justification

\_ Hysterical diseases /conversion: it occurs when individuals' complaints are appeared in physical manifestations such as paralysis and hysterical diseases.

\_ Factitious disorders: an individual intentionally imitates physical or psychological disorders. He seeks other's affection through the act of malingering.

\_ Hypochondriasis: some people have excessive stress on having a serious illness in order to escape and retrogress. By hypochondriasis, an individual eludes his responsibility, keeps himself away from feeling of guilt or avoids instinctual impulses. The mechanism of rationalization plays a main role in developing hypochondriasis. Thus everybody is assured that individual is sick while there is no medical evidence.

\_ Somatization: psychological conflicts are physically manifested because of this mechanism. Such as unjustifiable pains, digestive disorders.

## 6. Revengefulness

\_ Passive-aggression (such as bed wetting, feces incontinence): an individual indirectly expresses his aggression towards others in a passive action. For example, someone may be uncooperative in carrying out his duties or ignoring some diseases which affected others.

**Chapter 7**

**Programmable-self  
Software**

There are some parts accompanied by programmed-self software that are programmed through human's life. These new parts are programmed via the programmable-self software. Indeed, both softwares of programmed-self and programmable-self make human's characteristics. The programmable-self software defines/describes everybody according to what data he acquires in his life and how to apply the programs existing in the nature, foundation, institution and gene soft-wares. The programmable-self software manages the programmed-self programs. This software makes a condition to properly apply programs. Thus, human moves towards the path of perfection.

As mentioned earlier, some parts of the programmable-self are:

**Acquired Personality (Secondary Personality):** this is one of subconscious parts that is formed, programmed through the childhood. The secondary personality makes pattern from the environment and finds a definite direction.

**Automation Motions part:** patterns of human's successive motions are saved in the memory of automated motions/movements part in a little while. Afterwards, these motions are carried on without thinking. For instance, when a typist starts to learn typing, he has a lot of difficulties to find the place of each letters on the keyboard and spends lots of time for it. After a while, subconscious memory will acquire to the places of these letters and save the positions of hands and fingers. Then the typist automatically does this action so that he can type without looking to the keyboard.

## **The Extra Programming**

**A/ Conditional Programming:** human is programmed for many conditions according to pattern "if...., then..." Thus, he is frequently programmed for every behavioral patterns and even against many diseases. For example, people are programmed during childhood that if they come out of bath and sit in the wind, then they will surely get a cold or suffer sinusitis. These kinds of diseases are called "The Conditional Software-based Illnesses".

**B/ Reacting Programming:** there are a set of reacting programming so that an individual daily performs them. For instance, parents has frequently told their child to eat more because he/she is so weak, but there is no border for it how much he should eat. So the child is programmed according to this word. After a while, when he grows up and gains weight, he still likes to eat more. Or when a child defecates on a rug, he is blamed by his parents. Now this child who has grown up suffers the chronic constipation. Consequently, this program has recorded in child's subconscious so that the evacuation of bowel does not regularly occur.

**C/ Crucial Programming:** there is another program in the extra programming of programmable-self that is named the crucial programming. According to the crucial programming, individual demonstrates the behaviors and tendencies contrary to the primary traits. For example, if a girl continuously hears that she is similar to her father, she will display the male behaviors and tendencies in adulthood. Improving this kind of programming is very difficult.

**D/ filtering Programming (The beliefs):** this software includes/forms our beliefs. For example, parents frequently tell their children to be

wise and repeat this word so that these children just realize a pattern on the basis of formula " $2 \times 2 = 4$ ". Thus, they are programmed according to this cold logic and when they become adult, they cannot realize subjects out of the logic. So, they are unable to perceive metaphysical subjects. As a result, the filtering program locks the mind and not to let enter other information outside its framework.

Programmable-self is human's acquired personality which is formed by the environment. In other words, programmable-self software is programmed by the environment. All environmental programs such as individual, social, educational, governmental, global and extra programs as well as religious, cultural, social, political and economic attitudes/knowledge/trainings may influence programmable-self.

In general, there are three factors in formation of the programmable-self software in human beings. These three factors are subconscious, semiconscious and conscious. Subconscious part is a software that is mainly programmed during first five or six years of human's life. Primary principles are defined and saved in subconscious software; the primary principles include goodness, evilness and the institutional beliefs that determine individual's quantitative and qualitative capacities in adulthood. Therefore, subconscious programs are hardly changed.

Semiconscious part acts on the basis of a predicted program or internalized data through the life. All actions and reactions associated with semiconscious part are automatically fulfilled. This part contrary to subconscious part is accessible and changeable. An individual can reprogram semiconscious part when he consciously decides to exert changing.

There are some sections which is linked to the programmable-self such as physical (the senses of sight, hearing, smell, taste, touch), mental and ultra-mental receptors.

Mental receptors transmit many of perceptions to physical part whereas physical part does not distinguish this transmission. Thus, man's mental perception threshold is much boarder than his physical one. For example, the light with 50 Hertz is constantly and frequently seen through the eyes' physical receptors while it is turning on and off 50 times per a second; and only the mental receptors distinguish this off and on. In other words, mental receptors are accurately and momentarily recording and registering outward events. Thereby, all information is precisely received from the environment.

Moreover, the mental receptors record all the environmental data even while man is sleeping. Therefore, these receptors examine different archives of mind and receive different perceptions. By activating/programming mental receptors, they can organize mind's archives such as removing wrong data, classifying and arranging the received data.

It is required to mention that no information should be removed. As mentioned earlier, according to law of common survival, nothing including of matter, energy and data are annihilated in the universe. The law of survival embeds either matter and energy or data and awareness. The data is not annihilated/destroyed but is continuously recorded and registered with its details. There is a software that writes the details in a format of chemical message in mind. Hence, since human possesses a mental memory, all information will be eternally saved in his mind. Therefore, this information will be available even after individual's death.

The programmable-self is formed by lots of programs that are activated after one's birth. These programs help human to perform a proper management through his life (figure 7-1). These soft-wares and their associated properties serve human to achieve his superior purpose (as mentioned earlier). There will be briefly explained some of these soft-wares.

It is required to mention that non-organic viruses can make some alterations in programmable-self software; and these alterations are resulted from man's mistakes/faults. Contrary to this software, non-organic viruses saved in the programmed-self software exist for the faults of previous generations.

Figure 7-1. Software of Programmable-Self

### **Experience Software (Classifying data and drawing conclusion)**

Human's knowledge is classified and concluded in a package known as "experience". All the knowledge is provided for human's upcoming life although new experience may not be similar to the previous one/ may not be the same. The gained knowledge can influence upcoming life. Thus experience is one of the most effective soft-wares.

Moreover, an individual can apply the experiences when he fully processes the classified knowledge and produces a result.

### **Conscience Software (Ethical Evaluation)**

Conscience is one of programs installed in programmable-self software that plays an effective role in human's judgments.

Conscience software performs different ethical programs/principles on the basis of different defined programs in different cultures.

Mankind is born with a clean slate of conscience (moral evaluation part) which is gradually programmed by culture, nation, government, race, values and norms governing a society. Thus, there are many different conscience software depending upon different social programming.

Conscience is a software that assists people in judging and evaluating their thoughts and behaviors towards themselves. Conscience software is programmed with a feedback in which people are encouraged to do or do not actions. Social and religious cultures as well as individual ones are significant parts in programming conscience software.

### **Estimation Software (Guessing and Forecasting Data)**

Estimation (guess and forecast) software is another human's capability that enables him to forecast or guess new information

from known ones. In other words, he can estimate some unavailable information by observing available data.

### **Insight Software (Predetermined data)**

Insight is something which forms an individual's culture. Insight is man's understanding of the universe and events occurred within it. This perception is recorded with a format of a program in insight software. The programs of this semiconscious part either influence human's mental, emotional and physical reactions or determine significant role in his conscious decision making process. This fact indicates that insight software effectively participates in programming the programmable-self. In other words, insight embeds human's predetermined information that cause filtering incoming data. Thereafter, insight software is affected by the programmable-self software which forms new data. Insight and programmable-self soft-wares exchange data.

### **Choice Software (Data Selection)**

This software selects an appropriate information among different saved information. So there are many options to be chosen.

### **Information Arrangement/Organization/Setting Software (Thought)**

This software sets different data in an order that assists human to think. Thereby, human begins to think about everything and turns into/becomes a thoughtful one. This arrangement and thoughtfulness are so effective that make human to create a new position for himself. This software has a wide, accurate and complicated process to be executed.

## **Information Explanation Software**

This software enables human to analyze his information. This analyzing assists human to form an explanation by combining various data.

## **Software of Data Discovery from Knowledge**

Human can discover a set of new information from heart of his knowledge by this software. This software provides human to discover unknown data by observing known one. For example, in a car accident, a traffic officer can find accident-proof by observing visible/accessible evident in accident place. Indeed, unknown information is revealed by following available knowledge.

## **Software of Creating Data from Knowledge**

This software enables human to create new data from a set of available information. Meanwhile new data are created on the basis of a rational pattern (if...then...). In other words, new data are created step by step.

## **Software of Distinction of Data from Other Data**

Human can distinguish some data from others via this software.

## **Software of Comparison of Data with Data**

This software enables human to compare information with information.

## **Valuation Software**

This software defines each information value. This evaluation is exerted on the basis of individual's value criteria.

## **Parable Software**

Sometimes human conveys a meaning by the use of analogy and example/ the like. Nevertheless, this software requires an appropriate program or capability.

## **Attention, Precision, Concentration Software**

This software provides man for focusing solely on a special subject or listening to an appropriate person. For example, an orchestra leader hears just a special sound among lots of sounds.

## **Induction Software**

This software refers to inference of generalized facts from particular ones. Induction software exists/ is attached in human beings but is activated after birth by environmental factors.

## **Enquiry Software**

This software enables human to ask question about his available information.

## **Deduction Software**

This software refers to inference of particular facts from generalized ones.

## **Application Software**

This software is related to a practical use of human's knowledge. For example, an individual who designs something in his mind intends to apply it. So, he needs a capability to perform his plan by an appropriate operation.

## **Association Software**

People can recall event that occurred for some time past, for example, an individual suddenly recalls a forgotten event which happened 30 years ago by seeing someone. This software replaces a set of data with another set and associates two pieces of data.

## **Software of Mental Planning**

By being activated this software, human can research, design, invent and apply something in his mind.

## **Purposeful visualization Software**

This software enables human to embody anything in his mind. For example, someone has already seen a chair and now visualizes it in his mind, or he visualizes a new model of a chair which has not ever been seen.

## **Imagination Software**

This software creates information by making both purposeful and vain imaginations (illusion) in human's mind that are not externalized. Human forms his worlds (hereafter worlds) with his conceptions. Anyway, an imagination is considered a creation which is a part of this world and human is its creator. In other words, human's images make his world (world of human's inner imaginations) that have unique characteristics and positions in the existence.

Moreover, each illusion cannot be linked to non-organic viruses. For example, consider an individual put his hand under his chin and dip/plunge in his imaginary world for a little while afterwards he claims that his imaginations are not fertility. So, this imagination cannot be related to non-organic viruses.

## **Non-Organic Viruses**

Non-organic viruses are capable to influence both soft-wares of programmed-self and programmable-self. These viruses like computer viruses can alter any saved programs. For example, a computer which is infected by a computer virus displays many replicated and irrelative messages on the user's screen. Similarly, any non-organic virus which influences each software-based program of human beings can replace individual's knowledge and frequently produce alterations. As long as an individual can manage his imaginations, he has no problem. But when these viruses are loaded onto one's software-based programs, he gets into trouble for operating his saved programs. For example, a set of individual's software-based programs (induction, association, imagination, etc.) may be appropriately applied while other soft-wares (deduction, comparison, etc.) confront disturbances. Non-organic viruses may be main factors for making lots of these disturbances. Therefore, the individual by identifying the disturbances can control them and improve the made deficiency. For instance, when someone finds a foible in his rationalization software, he should remove this disorder and enhance this software. Nonetheless, the programs infected by these viruses are improved so harder.

As non-organic viruses are originally examined, many of problems related to these viruses are discovered such as how to these viruses penetrate into different software-based programs and what these viruses load onto each of these soft-wares; for instance, someone may suffer a hearing illusion while other one suffers a visual illusion. Thus, identification of these viruses' functional mechanism is so significant. Since these viruses have no organ, they will easily access to each software and alter programs. Consequently, human can get into a lot of troubles/may encounter so disorders via these

alterations. For example, an individual may suffer from some disorders such as induction, data-setting, analytic memory or one of these disorders. In other words, individuals may not suffer from all deficiencies. By discovering all these weaknesses and intensities, mankind attempts to improve them and step towards the best life.

## Chapter 8

# **Talent, Capability and Gene**

## **Talent and Capability**

Talent is a natural and potential ability that man is born with. Talent does not alone accomplish something. Capability refers to a developed talent which becomes practical. In other words, a talent is manifested in a format of a capability. Thus, an individual possesses a potential talent which is switched on and called capability.

**Talent = Potential base**

**Capability = Developed Talent**

All components possess talents and capabilities that are manifested throughout the existent world. The universe is a scene in which all talents and capabilities are displayed. A bean seed also has a potential for growth that finds the capability of sprouting in the suitable conditions. It is worthy to mention that human beings possess infinite talent-based programs which are predefined.

The potential talent is a base of positive and negative developments. Yet, there are two kinds of talent.

**1. The Hidden and innate Talent:** this kind of talent exists in the programmed-self software. This talent consists of different subsets:

\_ Foundational Talents

\_ Collective Talents (are affected by the Collective Soul and Collective Subconscious in embryo)

\_ Natural Talents

\_ Mother-Embryo Shared Talents during Pregnancy

\_ Inherited Talents (Genetically): these talents include physical-genetic traits or abilities such as people with euphonious voice.

**2. Acquired Talents:** there are some factors such as environmental conditions, various subjects and training that create talents. For example, one who practices soccer he turns his ability into an expert skill. However, success comes when one has the ability to use one's skills and talents. Skill is usage of speed and accuracy in doing special task that is known as developed ability. An individual is programmed by his skills and this program is recorded in individual's subconscious memory. Thereafter, different tasks such as driving, typing and various sports are automatically performed.

## **Gene**

Gene is a software which archives all good and evil information of several thousand years' history of human beings. This software-based part transfers all information created in previous generations, from beginning of the creation to the present. This process is like a relay running-race. During a relay race, members of a team take turn running with a baton in their hand. Each runner must hand off the baton to the next runner within a certain zone. Runners have to adjust their effort and speed to match their goal pace. They must monitor their speed otherwise they get into trouble. In other words, if a player runs slowly, next runner has to compensate.

Similarly, previous generations after the runs hand off the previous data to new generation. The previous generations have certainly executed some mistakes and the present generation has to make up for their deficiencies. There are good and evil records of the previous generations. For example, there may be a generation with a gene of longevity while the next one may not possess this gene. A generation's longevity depends on a correct lifestyle that leads to the

longest one's life span. This good record may turn into a bad record in the next generation who has incorrect lifestyle. Furthermore, there were not any diabetes or heart diseases in previous generations while the present generation suffers these diseases. Therefore, a generation can make an alteration in the gene's software-based section so that this wrong information is archived in gene and then is passed into next generation. Consequently, it normally assumes that people suffers from heart disease or diabetes through gene. Thus, the patient thinks that his illness is not curable and he will be condemned suffering this disease throughout his life.

As it earlier mentioned, psymentology approach, in accordance with the law of change, cures heart disease or diabetes thus preventing they transfer into next generation. In other words, gene is not a barrier for curing all genetic diseases. So, this common treatment method makes repairs and corrections in the gene's software-based program. Therefore, no negative data is conveyed to next generation.

In other words, wrong lifestyle of the previous generations manifests as diseases or disorders in following generations. Indeed, each generation's disease transfers to the next one and vice versa. A generation's longevity and healthy life are related to a correct lifestyle that surely transfers to the next generation. Thus, gene archives the positive and negative records. Nevertheless, each generation does not have to bear the evil record of previous generation. Each data recorded in the gene software is changeable so that next generation can improve any disorders related to the previous one.

Gene encompasses both software-based and hardware-based data. Gene's hardware-based data is related to physical body that

determines the traits such as facial features, height, hair and eyes color (morphology). The hardware-based part of gene follows the law of inheritance (Mendel law...). Moreover, the hardware-based personality types (melancholic, choleric, sanguine and phlegmatic temperaments) are in gene software. Gene software-based data embeds physiological good and evil records (functional parts) of previous generations and individual's behavioral tendencies.

According to the above divisions, the hardware-based data of a gene is constant and inflexible while the software-based one is changeable. As a result, a gene behaves like a circuit complex that determines switching on a circuit, degree of weakness and intensity of individual's tendencies and functioning of body members.

Man has an inherited temptation toward drugs in his gene database. By activating gene software-based part, the instructions recorded in this hardware-based part are executed and the desire for drugs is conveyed to next generation. Yet, the new generation can increase or decrease the intensity of this tendency. Thus, this new message is recorded in the software-based part and transferred to the next generation. Another example refers to an individual's inclination for poetry. This capability is recorded in the software-based of gene but this faculty is not inherited and must be created. Man's temperaments are affected via tendencies and desires which are displayed in software-based part of gene.

According to the laws of Mendel, gene is inherited from parents. Therefore, the laws of Mendel are designed and saved in the cluster of gene but are not yet activated. In other words, there is an archive of gene which is created to define some programs. Nonetheless, this archive is still empty and it needs to be programmed. So, gene is like an archive shelf which has no file within it.

## Talent, Capability and Gene

As it earlier mentioned, ecosystem designs character. Character embeds infinite talents that are not activated at birth. Indeed, gene is initially defined as a potential talent (foundation of talent). Gene is not effective in activating a potential talent. Thus, there must be a behavior to execute the law of Mendel to develop a potential talent into a secondary talent. Afterwards, this secondary talent creates capability or behavior. This capability is developed and its relevant chemical messages are activated inside the gene. Then this capability is switched on. In other words, there are infinite capabilities and switches associated with them in gene software. So, by activating a chemical message related to a capability, gene receives this message. Now, gene archives these recorded messages and transfers them to next generation. Subsequently, the secondary talent is affected by gene and this cycle continues (figure 8-2). This cycle shows that human beings are interrelated and are affected by each other's good or evil records.

Figure 8-2

Therefore, there is an important principle that chemical messages associated with each of infinite talents are programmed in gene software. For switching on each talent, a chemical message associated with that talent is activated in the gene. Thus, gene records a background for each capability and takes it to the next generation. Every behavior is manifested via switching on a talent so that a chemical message is translated in physical language. So there is a special chemical translation for each mental, emotional and physical skills that is saved activated.

As a result, the gene is programmed in programmed-self software. Moreover, programmable-self can receive both positive and negative programs. Nevertheless, negative aspect of these programs may be displayed.

There is a main title in Faradarmani and psymentology approach. This positive point refers to inherited disorders that can be cured in a generation; so the next generation is saved from these diseases. Hence, Faratrapist and psymentotrapist emphasize that positive improvements must be exerted. Thus, next generations get into troubles fewer times. For example, the present generation suffers from a kind of muscular dystrophy known as Duchene. So that when this disorder can be cured in this generation, the next generation is kept away from this disorder. Therefore, a good record is conveyed instead of an evil one.

Gene is a package which possesses infinite switches. These switches are initially designed but are not activated. Each of these switches is activated via a chemical language associated with it. Indeed, there has been no behavior at the beginning that is affected by gene. There has also been no programmed gene which creates a behavior. Afterwards, each created behavior is switched on by a chemical

message. For example, when the members of a generation begin smoking, most of them become addicts. Thereafter, the smoking capability is switched on and is followed by the next generations. Nevertheless, when a generation attempts to decrease intensity of this capability, a few individuals will become addict.

In other words, addiction capability is defined for man at birth so that he can switch on this software-based data of genes. The researches performed on laboratory mice indicate that the mice become addicts after receiving an easy-absorbed source of energy thus they do not go after cheese.

Therefore, at first a behavior is manifested and chemical message are produced. Thus, the good and evil records of this generation are recorded in a database. Next generation takes these histories from archives. For example, the members of this generation decide to do exercise. Thereafter chemical message associated with exercise is activated and then recorded in gene software. This good record is applied by both the present generation (before a child is born) and next one. Consequently, a behavior must be created to be archived through gene. Moreover, when a child is born, software-based data of gene are activated then the law of Mendel is applied.

### **Mutations and Genes**

At the beginning of creation, gene software is programmed in the potential talent. This software remains switch off until it receives a message. Since no child is still born, no behavior is created.

Therefore, the data of this software can, one by one, be applied after the birth. Each of these data may be gradually defected by the environmental, behavioral and many other disturbances. Thus, genes are responsible for transferring many different disorders at the present time.

Throughout history, the gene software has been gradually damaged. Each negative feedback of a behavior has been continuously recorded in gene software. Furthermore, a set of destructive factors (such as various waves, non-organic viruses and etc.) has influenced this software. Therefore, the gene software was clean at the beginning of man's creation. Humans made genetic disorders during the last thousands years and injure this software. History shows that behavioral disorders feedback produces negative effects on the gene. He has switched on the programs which have been off for billions years. So, man should expect more genetic disorders day by day.

Human and ecosystem are exposed to lots of destructive factors in gene software that man is still unaware of them now. The wave's pollutions (produced from cellphones and etc.) can cause the alterations all over the ecosystem. For example, hundreds whales died on a beach. These animals suffer from unbearable frequencies which created disturbances in their hearing field. Whales' gene software may be affected by these disturbances. Human is not still aware of the alterations which he is creating in the ecosystem's gene software. Meanwhile, these genetic changes may even detect/develop cancer in other beings except human beings. Nowadays, man uses chemical fertilizer in agriculture. The chemical fertilizer may be harmful to plants as well as make problems in agricultural regions. Moreover, man is still unaware how much the chemical fertilizer may have damages in the ecosystem. Human beings causes the changes in the ecosystem. By referring to the past histories, man can discover the recorded behaviors which cause these genetic disorders throughout the ecosystem. It is obvious that he has an important role in creating these disturbances.

Since man is a profit-seeking, he must expect enormous tragic events throughout his life. He is a complicated system that many principles govern him. He is like a machine that possesses lots of potentials. Consider a cellphone has lots of potentials that its effective usages should be discovered by a user. Many cellphones are so expensive but a user may just utilize ten percent of these devices' capabilities. Consequently, man possesses infinite talents and capabilities which are unknown for him/ that is unaware of them. Therefore, he should pursue self-cognition.

# Chapter 9

## **Intelligence, Wisdom and Memory**

Psymentology's approach which suggests the new recognition of human beings refers to infinite complexities of man's existence. For accessing and applying each component of human beings, he needs special preliminary principles. According to these principles, man must have an Interuniversal viewpoint toward human beings. In this viewpoint, for identifying human beings, he must widely and wholly look at himself. Thus, he would enjoy the physical (five senses), mental and ultra-mind sensors. As mentioned earlier, ultra-mind sensors refer to inspirational receptors which are able to create new information. Psymentology presents a knowledge that can precisely and practically define creativity and intelligence.

For presenting the appropriate views about developing creativity, man needs to define some concepts. If we call a purposeful and organized system or an intellectual organization a framework of **logic**, then we may call the capability of creation of this framework "**intelligence**". Moreover, capability of applying and enjoying each framework of logic is known as **wisdom**. Thereby, **memory** refers to capability of archiving and saving the data of framework of logic.

Consequently, there are efficient factors in making intellectual activities:

- \_ Intelligence (Creation)
- \_ Wisdom (applying)
- \_ Memory (Archive)

## **Creativity and Different Definitions**

Creativity is a very important element in every successful educational system throughout the world. Today's educational programmers are considerably interested in developing and enhancing creativity faculties. Nevertheless, educational systems consider a limited part of this creativity faculty. Creativity has a broader meaning which is beyond the capabilities of apparent intelligence and memory. However, a society and its educational system emphasize developing apparent intelligence and memory but not creativity.

Are the capabilities of wisdom and memory sufficient for flourishing creativity? As man has identified his mental and emotional functions in previous years, he will discover his existential capabilities through studies and new experiences. Psychology intends to examine inner intelligence (insight) which is the main factor in developing creativity. Therefore, human beings step towards the path of perfection.

### **Wisdom (Apparent Intelligence)**

Wisdom is the ability to reveal individual's intelligence. Wisdom is the capability of applying skills and abilities such as:

1. The ability of using tools of data setup, for example:

\_ Reasoning, deduction, induction, association, visualization, calculation, statistics, analyzing, distinction, comparison, evaluation, decision, classification, data setup, information discovery, inquiry.

2. Skills:

\_ Skill of using language of physical body for expressing thoughts and emotions

\_ Skill for using members of body for establishing balance, coordination, power, flexibility and speed

\_ The skills for identifying and classifying plants, animals and environment

\_ Skill for controlling emotions such as anger, happiness, sorrow and ability of making a proper connection to others in each of these states.

### 3. Capability of applying:

\_ Ability of comprehension, distinction, conversion and performing musical features

\_ Ability of understanding and distinguishing individuals' psychic states, purposes, motivations and feelings

\_ Ability of influencing others

\_ Ability of using the words orally or in writing

\_ Ability of position selection and self-concept

\_ Ability of using physical data and five senses

\_ Ability of abstract wisdom, management in crisis, inquiry, testing

\_ Ability of memorizing

\_ Ability of expressing thoughts and psychical states/moods

### 4. The ability of identification such as:

\_ Identifying space, time and insight

\_ Identifying color, line, formation and space

\_ Identifying self, abilities, limitations, inner states, purposes and motivations, temperaments, tendencies, self-control, discipline, perception and self-esteem

\_ Understanding the meaning of death, life, destiny, love and art

It can be said that the mentioned skills, abilities and capabilities (are the outcomes of wisdom) do not inevitably lead us to creativity. In other words, these tools cannot create something which did not exist. Hence, these tools facilitate developing other parts.

According to Psymatology, wisdom is a key for revealing individual intelligence. When wisdom capability is not developed, no creativity appears because there is no tool for its appearance. Therefore, man develops wisdom to reveal the effects of intelligence. Flourishing creativity and developing intelligence needs more preparations and facilities.

## **Intelligence**

In Psymatology's approach, intelligence is a capability of enhancing creativity, innovation and producing new information. Intelligence creates man's inspirations that can occur in wakefulness or sleep. The intelligence traits are as follow:

Intelligence is innate, common, hidden and non-hereditary.

Intelligence needs to be awakened and activated.

Intelligence is equivalent to creativity; that is a qualitative ability.

Intelligence like wisdom is not programmable and learnable. In other words, intelligence cannot be enhanced by training. So, wisdom contrary to intelligence is an ability which can be enhanced by training.

Intelligence which is a qualitative ability is immeasurable. Intelligence quotient (IQ) actually refers to wisdom ability. It should not be ignored that developing all types of intelligence (with different and current definitions) plays a significant role in the ideal educational systems. In Psymatology's approach, Intelligence Quotient (IQ) is actually Wisdom Quotient (WQ). Thus, IQ tests are wisdom tests that can be called WQ tests.

Therefore, according to this approach, creativity as a qualitative issue is not measurable. For example, a poet or musician gains his literary or musical words through inspiration. Inspired poets, musical notes and scientific discoveries are not quantitative.

As mentioned earlier, intelligence must be activated and motivated while wisdom needs to be educated. Thereby, there are factors that can activate the hidden intelligence. History has witnessed innovative people whose apparent intelligence was not extraordinary. Their creativity is suddenly manifested in the form of novel thoughts. Creation follows a mental spark beyond place, time and physical language while wisdom creation occurs in framework of time. This innovation as well as reasoning discovery is created step by step.

Artificial Intelligence is an area of science in the new world. This kind of intelligence is an application of logic. Artificial Intelligence is installed in the processing systems on the basis of the phased logic theory. This theory suggests a system of comparison and selection that is applied in electrical units. Artificial intelligence creates nothing but enhancing capabilities of the unit according to the phased program. No electrical system is capable of creating data for man. Thus, man can only define programs for each system so that this system can produce new programs with adjustment to available

programs. Intelligent trait attributes to someone or something that can create data.

In some educational systems memory has been categorized as Intelligence. Educators try to find ways to develop student's memory. According to educational systems, developing memory is very important for the purpose of influencing student's future actions. In other words, an individual who memorizes everything well gets high scores and becomes known as genius.

## **Memory**

Memory is defined as a significant factor which is related to wisdom and intelligence. Memory is a faculty of mind by which information is archived, stored and recorded. Memory acts like a computer hardware.

Therefore, memory performs neither like wisdom nor like intelligence. Memory is a system for recording events and words in itself. Meanwhile, memory finds its meaning besides intelligence and wisdom (figure 9-1). In other words, no software of human beings can be performed without having memory. Thus, wisdom acts via some different soft-wares whose functions have earlier been recorded in the memory. For example, the principles of reasoning have early been recorded in man's memory and then these principles get applied.

Since the subject of "memory" is very important and educational systems work on the basis of memory- based method, this subject should be substantially discussed. The memory-based system should convert to the creativity-based system; thus this subject must be analyzed.

Moreover, the educational systems are involving the main challenge by not caring about student's creativity development. Student may get the best grade in this system but this grade does not represent his high creativity. The high grade may have been achieved as a result of flourishing creativity and activating inner intelligence. But getting this grade cannot inevitably lead to creativity.

### **Inner Intelligence (Insight) and Creativity**

Inner Intelligence (Insight) refers to the capability of creation. Creation is the act of bringing something new into the existence. An individual creates something via inspiration and accesses to data treasure of universe. A creation occurs when an individual finds the cosmic data treasure. This data passes through the ultra-mind and mental receptors. When the mental receptor receives the data, this data is changed into the new data. Each receptor receives the data in its special language then translates and delivers it to the brain. Thereafter, the brain displays this translated data in the format of the physical language.

One section of the brain translates the information of inner intelligence and the other one translates the information of apparent intelligence (figure 9-2). The innovative people's brain translates the data arisen from their inner intelligence. Many people leave their inner intelligence faculty intact. As long as man enjoys his inner intelligence, he will avoid illnesses such as Alzheimer disease.

The information gained from the inner intelligence is new and pure innovations. Nevertheless, some new information is often added to the previous information and then new innovations are created. For example, James Watt invented the steam engine after fire and metal had already been discovered.

Human beings can create something new via inspiration (function of inner intelligence). Therefore, data should be extracted from somewhere and this extraction is gained from man's inspirations. Inner intelligence is a part of human existence that needs detection factors. Man needs mind, brain and book of existence to detect something new. Connection between the mind and the brain is so significant. For example, in people with mental retardation, brain cannot receive data from mind because their brain and mind cannot link well together. So, their observations from the book of existence are not transmitted and the signs of mental retardation appear. Since there is no proper connection between mind and brain, individual facial features do not normally grow, too.

As long as the relationship between mind and brain is not established, brain cannot translate external data. Thus, individual morphological traits, shape and structure are not genetically transmitted to other generation. When man's mind remains inactive, individual's morphological traits are not extracted from gene and not applied. So, individual's physical characteristics do not normally grow. Mongolism is the last form of abnormal patterns of physical characteristics. The basic structure of mongolism disorder is different from its early forms. So, being unique is one of man's characteristics so that everyone's brain has an appropriate/ unique translation of his mind's conception. Thus, no two brains' translations is the same.

Man's innovations rely on his mind, the book of existence and his brain's functioning. Nevertheless, these innovations are arisen from inspirations when an individual attains the **Mindless Mind**. For example, a poet or a composer tries to write a rhyming poem or a rhythmic music. The composer starts with a basic cord progression then builds and changes musical notes to compose a new melodic music. However, when a composer forgets his outstanding

knowledge in music, he can create new well-known pieces in the state of Mindless Mind. Or a poet can write a new poem without using the poetic elements and techniques when he is in the state of Mindless Mind. Thus, this inspired and pure poem is the result of creativity and innovation that is originated from the poet's inner intelligence. Most poems and musical pieces have expiration dates; so they gradually lose their pleasance and charming effects. Therefore, the inspired arts never lose their freshness and desirability.

In psymentology, one of the theoretical definitions of inner intelligence or insight is:

Inner Intelligence (Insight) = Ratio of Inquiry, findings and innovations / Ratio of Individual's Knowledge

By looking at the history, the inner intelligence (Insight) has retrograded through many years. In spite of that, apparent intelligence or wisdom has excessively developed since the past.

Man's experiences prove that the more apparent intelligence has developed, the more problems are created; because the abnormal tendencies have also been developed. It should be considered that by developing wisdom capabilities, regardless of enhancing an individual's inner intelligence, the society is impelled towards priority-seeking, false emotions, energy repletion, agitation and imbalance. Therefore, people with developed wisdom are psychologically known as genius. But they are unable to control their excitements, variety-seeking behaviors and libertine tendencies towards new experiences which lead to abnormalities. These individuals may even use psychoactive and addictive drugs.

Therefore, psychologists were initially induced to improve the above disorders by considering the emotional intelligence. Then they completed their discussion by adding new types of intelligences such as spiritual intelligence which embeds the meanings of life and death. But the mentioned disorders in psychologist's theoretical view were not improved by adding some types of intelligence. Moreover, some psychologists attempted to equip the genius people with new religious attitudes. Thus, they could control the genius's apparent intelligence to prevent them from leading towards abnormalities. Consequently, these psychologists were induced to define the new words such as insight and clear-sightedness. But man did not step towards perfection after applying mental, emotional and physical capabilities.

It should be said that all knowledge, discoveries, inventions and innovations are created by the capabilities of inner intelligence, insight and true clear-sightedness. But these capabilities have gradually declined throughout the history. Contrary to suggestion and conditioning, Intuition and illumination which are aided by spiritual information, dominate false emotions. So, insight and inner intelligence are a significant factor in controlling external tumult which is rooted in wisdom or apparent intelligence acts. This main factor should be considered a social and humanitarian issue.

It should be properly enlightened why inner intelligence and insight have declined throughout the history. For example, someone asks whether it is preferable to build the Space Shuttle or to build the steam engine. Then everybody certainly answers that building the steam engine is the predecessor to Space Shuttle. Now, if we ask ourselves which one is more important: invention of the steam engine or discovering metal, then we probably answer, discovery of metals. Otherwise, man could not actually build the steam engine.

By making more inquiries, one may ask whether fire discovery is more important or metal discovery. Thus, the precise answer to this question is fire discovery. So, fire discovery is the most important element.

### **Fire Discovery > Metal Discovery > Steam Engine > Space Shuttle**

It should be questioned whether man can discover or innovate something that is more important than fire. The answer is that man can offer nothing which is more important than his previous findings. Thus, his present position is resulted from his previous findings. In other words, man's previous findings and innovations are always more important than his next ones.

Now it can be questioned that what findings persuaded man to think about the discovery of fire? (and this element is still the most important discovery in the world)? Similarly, there is a serious question in man's mind: "who am I? And who is my creator?" This substantial question has caused man's mental disturbance throughout the history. He asked this question when his knowledge range was too narrow. Today's knowledge and technology are produced from man's initial findings. In other words, this main question makes man achieve his present position in the world.

Each of man's inspirations (reaching the universe data) is resulted from his enthusiasm. He attains all information because of his eagerness. Man innovates because of his interest to learn and to know. The primitive man's most important question was who he/she was.

As mentioned earlier, in psychology inner intelligence or insight is the ratio of an individual's inquiry or comprehension to his knowledge. Nowadays, man encounters significant and new

questions in the world of science. But he entered the humanity phase when he asked who he was and who his creator was.

Insight = Who am I? / Man's Knowledge at beginning

Man's knowledge at beginning > Q2/S2 > .../... > Qn/Sn

According to psymtology, insight is a factor for controlling apparent intelligence. Otherwise, apparent intelligence or wisdom who changed into a factor for man's libertinage. History witnesses that people with the high apparent intelligence possess the low insight and low inner intelligence. By looking at the last generations, everyone is ensured that last generations enjoyed the high insight. So, insight has been gradually declined as man's knowledge enhances.

In general, a naughty child is rarely understood by the world's educational systems so that he may even get rejected. This naughty child, contrary to a quite one may possess special abilities. For example, he may be asked what he wants to do later in his life, he replies that he is going to do nothing. Thus, everybody may think that this child has a low IQ. But after investigating this child's answer, educators realize that his reason seems true. The child might mention in the future that he does not know how to get to work place. In sociology discussions there are many cases such as the one described which ascribe labelling of these children as stupid and low IQ. On the contrary the child does not have low IQ. Consequently, educators must offer alternative methods for developing these children's abilities and talents.

After several decades, new experiences in psymtology indicate that there are distinctive methods for activating inner intelligence in comparison to apparent intelligence. Activating inner intelligence is

the same of receiving inspiration, attaining illumination and intuition. The recent experiences show that inner intelligence creates so many marvelous outcomes. For example, consider an individual who has not ever written any poem, and then suddenly he creates a great poetical composition.

As man's five senses are the entry of outward data from brain to mind, mental and ultra-mind receptors also transmit data to the mind. Ultra-mind sensor is activated by data processing, and then inner intelligence is switched on. Moreover, mental sensor is located at the entry of mind whose perception threshold is broader than physical ones makes another entry of mind. For example, a part of what we dream originate from mental receptors.

Physical perception threshold leads to the discovery of logical uncover along to WQ (wisdom quotient). Emotional perception threshold causes the appearance of enthusiasm. Mental perception threshold provides the capability of visualization, imagination and thinking. Ultra-emotional perception threshold provides man with receiving emotional inspirations. This threshold acts beyond time, place and physical language. Artistic inspirations such as poetry and music are attributed to this threshold. Ultra-mind threshold provides man with receiving comprehensible inspirations which are beyond time, place and physical language.

Ultimately, the authorities of educational systems should pursue activating and developing inner intelligence. By enhancing inner intelligence, man can develop wisdom capabilities and discover his/her true talents.
